MITSUBISHI ELECTRIC

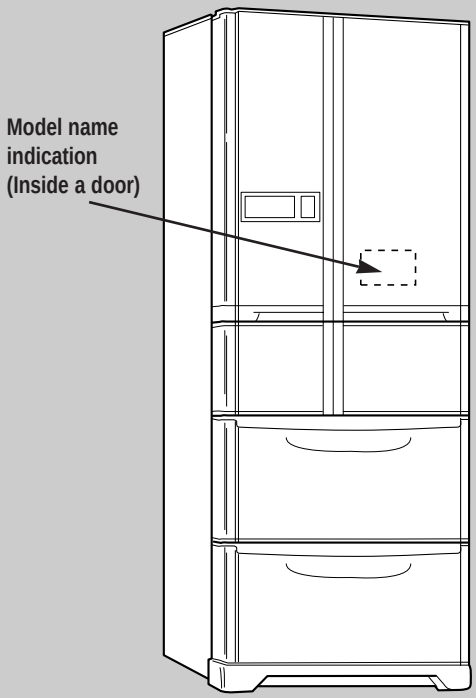
Changes for the Better

HOME REFRIGERATOR

No. OA090

SERVICE MANUAL

Model **MR-G50J-SS-NZ**



NZ·····New Zealand

CONTENTS

NOTE:
• RoHS compliant products have <G> mark on the spec name plate.

1 FEATURES

MR-G50J-NZ

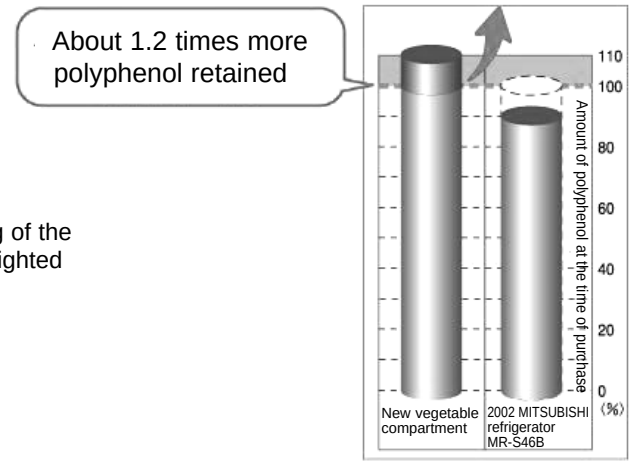
1. Vegetable compartment

(1)Mechanism

Two LED lights are mounted on the back and bottom of the vegetable compartment. The LED (UV LED) emits 375nm light, which is the effective wavelength for biosynthesis of polyphenol. This revolutionary vegetable compartment stimulates self-defense function of vegetables and increases polyphenol by irradiating ultraviolet light to vegetables for a certain period of time.

* The lighting of LED is not controlled by opening or closing of the vegetable compartment door. Thus, the LED may not be lighted when the door is opened.

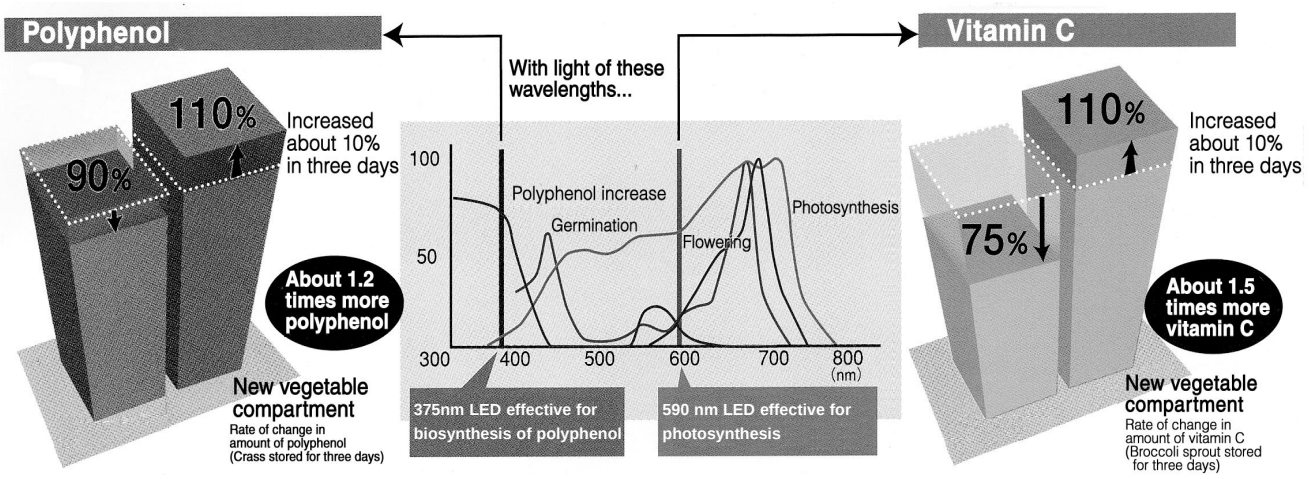
Rate of change in amount of polyphenol
(Cress stored for three days)



(2)Effect

Polyphenol in vegetables increased by 10% compared to the time of purchase, and the amount of retained polyphenol was 1.2 times more than that of the vegetables preserved in prior refrigerators without light radiation. (See graph)

Among different wavelength of light included in sunlight, lights of wavelength that "stimulates photosynthesis" and "stimulates polyphenol increase" are used in the vegetable compartment.



2. " Auto Door Shut" function installed enable doors to be shut easily.

"Auto Door Shut" function automatically closes the door when its opened angle is less than 20 degrees.

3. Easy Access Vegetable room, Easy Access Freezer Room

The slide rollers enable smooth movement of vegetable and freezer rooms.
Double rails allow the rooms to be pulled out completely, providing easy access to even the back of the rooms.

▼Slide rollers

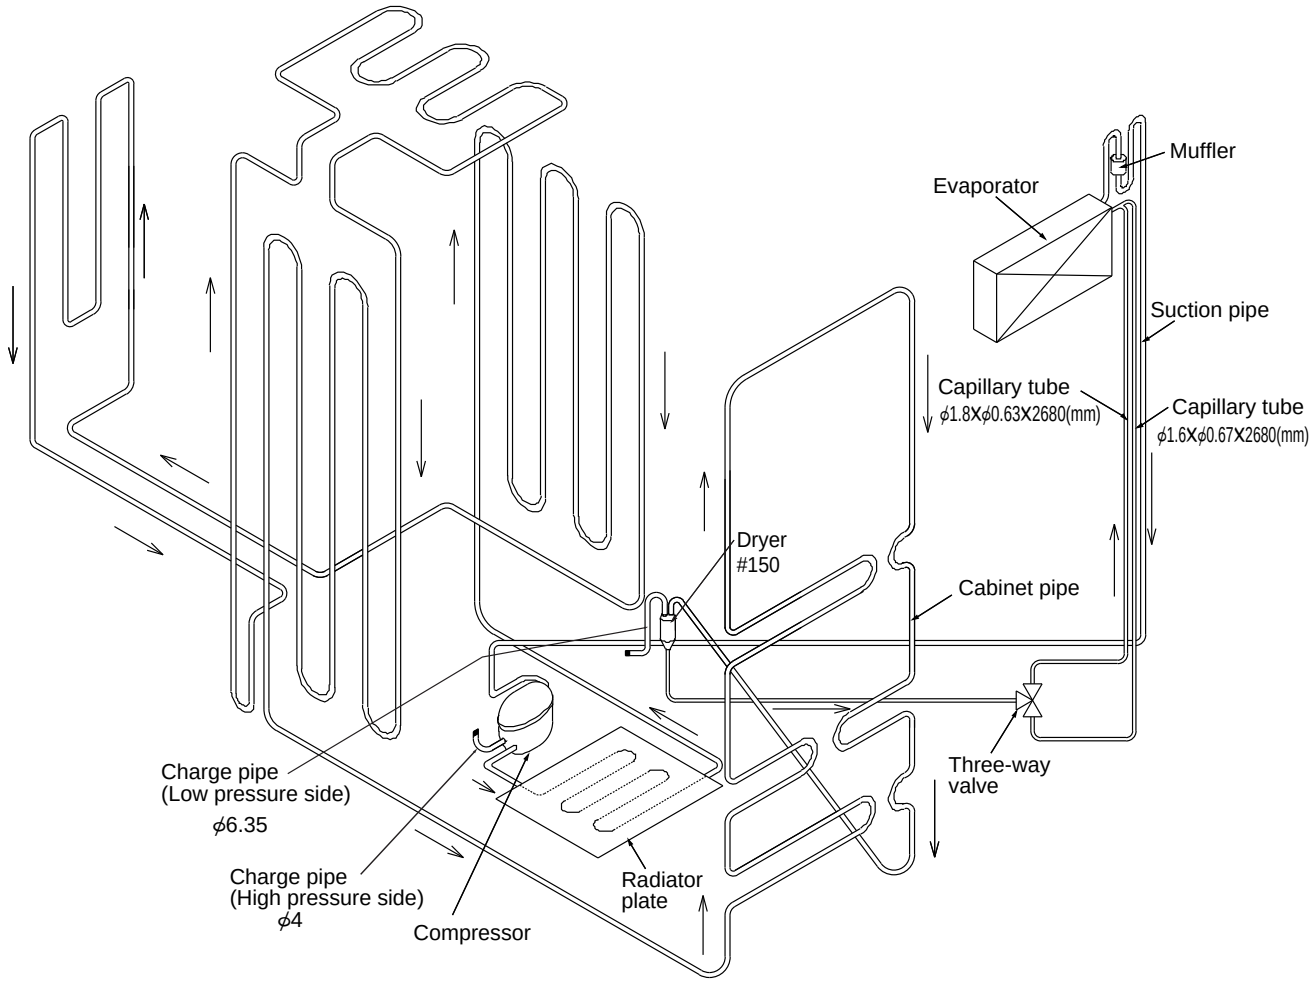
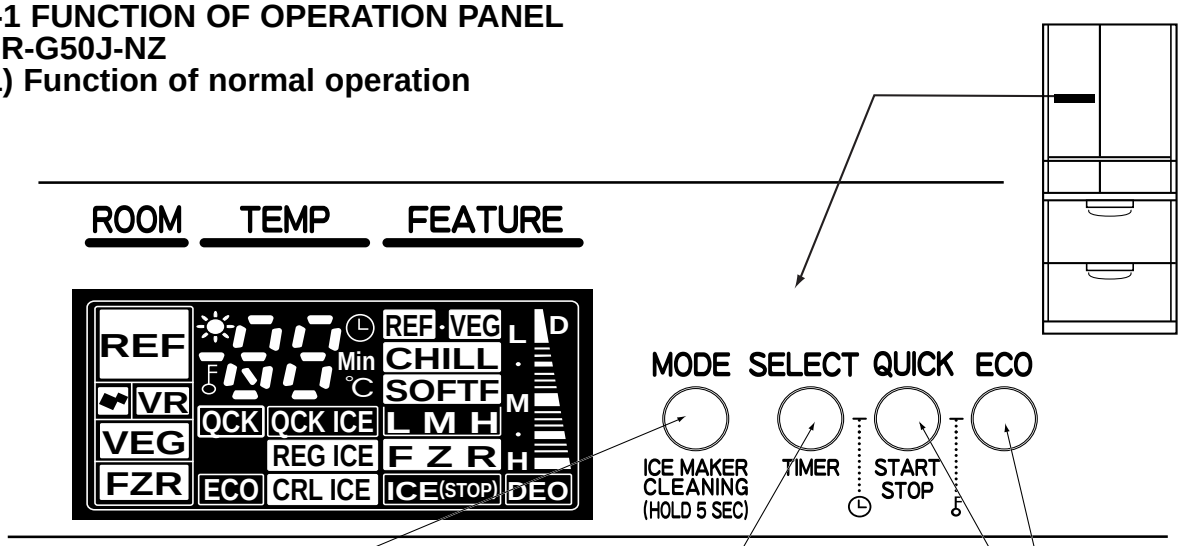
5 REFRIGERANT CIRCUIT

MR-G50J-NZ



6 TROUBLESHOOTING

6-1 FUNCTION OF OPERATION PANEL
MR-G50J-NZ
(1) Function of normal operation



MODE switch

●The switch functions to select the required compartment.

MODE

Press ◯ switch and display the required compartment to apply the function of temperature adjustment or quick mode.

SELECTION switch

●The switch functions to set the operation mode or temperature of compartments individually.

When setting the operation mode of refrigerator, vegetable, and freezer compartment to "Middle" at the same time.

QUICK

Press ◯ switch for about 3 seconds until a "beep" sound is heard.

QUICK MODE switch

●Each compartment can be cooled rapidly.

Quick mode is finished automatically.

It automatically finishes about 2 hours later.

When stopping quick mode halfway

QUICK

Press ◯ switch again.

When stopping quick mode of all compartments at once

QUICK ※

Press ◯ switch for about 3 seconds against one of the compartments which is in QUICK MODE.

※ To reset the unit to the initial setting, press QUICK ◯ for 3 seconds. The setting of the refrigerator compartment, vegetable compartment, and the freezer compartment will be set to "Middle", and fast cooling operation, energy-saving operation, and cooking timer setting for all compartments will be canceled.

ECO MODE switch

●Each compartment can be operated with energy saved.

Convenient function

1 Cooking timer

SELECT QUICK

Press ◯ switch and ◯ switch for 1 second at the same time. (🕒 is displayed.)

(Cooking timer can be released in the same way.)

Cooking timer mode is set and "0" blinks.

SELECT QUICK

Set the time with ◯ switch. → Press ◯ to start → Alarm sound will annonce the completion of cooking period.

(1~99 minutes)

(To stop the timer halfway through the operation, press QUICK ◯ again).

2 Child lock

QUICK ECO

Press ◯ switch and ◯ switch for 3 seconds at the same time. (🔒 is displayed.)

(Child lock can be released in the same way.)

3 Ice making stop

MODE

Press ◯ to select "ice making compartment".

→ Select ICE(STOP) with SELECT ◯ switch.

4 ON/OFF of LED for bacteria removal from water tank

MODE

◯ to select "vegetable compartment".

SELECT ECO

Press ◯ switch and ◯ switch for 3 seconds at the same time.

(☀ is displayed.)

To use "ice making compartment" as "refrigerator compartment"

①Press MODE ◯ to select "ice making compartment."

②Press SELECT ◯ for about 3 seconds and let REF flash.

③After ice-making compartment is set to function as refrigerator, take ice or water out of the ice tray which are automatically dropped into ice storage bin. When ice-making function will not be used for a while, wash the water tank well with water and place it back after drying thoroughly.

④To get back to "ice making", just change the temperature setting.

Operating mode and Temperature range

Compartment	Mode	Temp range
Refrigeratorcompartment	Middle	Approx. 0 to 6℃
Versa compartment	Refrigerator	Approx. 0 to 6℃
	Chilled	Approx. -2 to 2℃
	Soft freezing (Middle)	Approx. -9 to -5℃
	Freezer	Approx. -18 to -16℃
Ice making compartment	Refrigerator	Approx. 0 to 6℃
	Ice making	Approx. -21 to -17℃
	Ice making stop	Approx. -21 to -17℃
Vegetable compartment	Middle	Approx. 3 to 9℃
Freezer compartment	Middle	Approx. -21 to -17℃

※The temp range above is based on the data measured at the center of each compartment with the door closed and with no food inside under the condition of ambient temperature 30℃. The range varies depending on circumstances.

(2) Demonstration mode for shop display

Demonstration mode is not available when the temperature of freezer compartment is -7℃ or less even if SELECT , QUICK and ECO are simultaneously pressed for about 5 seconds and a “beep” sound is heard. Cooling operation starts instead.

① Setting

●Within one minute after power supply is turned on, simultaneously press SELECT , QUICK , and ECO switch for about 5 seconds with the door of ice making compartment left open. When the setting is complete, a “beep” sound is heard and “D” is displayed.

② Panel operation mode during demonstration mode

The panel operation mode changes to “manual” if any of the switches is pressed and it changes to “auto” if none of the switches is pressed within 3 minutes after demonstration mode is set.

Manual mode: Panel indication changes according to switch operation.

Auto mode: Panel indication is automatically changed.

③ Release

●Simultaneously press SELECT , QUICK and ECO switch for about 5 seconds with the door of ice making compartment left open. When the function is released, a “beep” sound is heard. “D” disappears and the panel indication gets back to normal.

Note: Follow the procedure above to release demonstration mode as it cannot be released by simply turning on/off the power supply.

(3) Fine adjustment of temperature

Fine adjustment of temperature is available for refrigerator compartment, freezer compartment and versa compartment.

As for versa compartment, however, it is only available when the compartment is set to REF or FZR .

① Setting

●Press MODE switch to select refrigerator compartment, freezer compartment or versa compartment.

●Simultaneously press SELECT and ECO for about 3 seconds until a “beep” sound is heard.

●The indication changes as show in the right.

② Fine adjustments of temperature

Temperature adjustment is made by approximately 0.3-0.5℃ by pressing SELECT and it is indicated with 15-steps bars on the panel. The temperature displayed on the panel, however, changes by 1℃ and might not change according to fine adjustment.

Example of display:

In case of versa compartment

●Press SELECT to make versa compartment function as refrigerator or freezer .

When the blinking marks on the display, REF or FZR , are lit in 3 seconds, apply fine adjustment of temperature.

③ Release

Follow the same procedure as setting and the finely-adjusted temperatures are reset for refrigerator compartment, freezer compartment and versa compartment at once.

(4) Ice making test / Self-check

This function is not available during the following modes: Child lock, Demonstration, Cooking timer, Changing the rotational speed of compressor, and Error code display.

① Setting

●Press MODE for about five seconds.

② Operation and its display

●While automatic ice making is testing, the indication of ice making compartment setting blinks on LCD.

●When something is faulty, the error code is indicated.

③ Release

The test automatically finishes in 10 minutes and the error code changes to temperature display.

(5) Thermistor temperature check mode

① Setting

●With the door of ice making compartment left open, simultaneously press MODE and QUICK for about 3 seconds until a “beep” sound is heard and “88” blinks.

●Press ECO with the door left open.

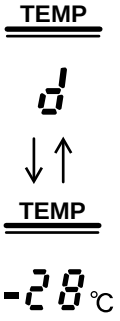
② **Display**

After the setting is complete, the kinds of thermistor and its temperature are alternately shown on the panel. In case of abnormality, the display returns to current temperature**.** Please note that the temperature detected by thermistor may be a little different from the real one due to the influence of refrigerator temperature.

Kind of thermistor	Defrosting	Refrigerator compartment	Slide chilled compartment	Ice making compartment	Versa compartment	Ice making tray	Vegetable compartment	Freezer compartment	Outside air
Display									
	(d)	(R)	(C)	(K)	(S)	(I)	(V)	(F)	(O)

③ **Change of display**

(Ex.) When defrost thermistor reads -28℃.



●While thermistor temperature check mode is set, press SELECT ◯ . A short beep sound is heard at each press and the thermistor is changed in the order below.

Defrosting → Refrigerator compartment → Slide chilled compartment →
→ Ice making compartment → Versa compartment → Ice making tray →
→ Vegetable compartment → Freezer compartment → Outside air →

※ The defrosting thermistor is always selected first at the beginning of the setting.

④ **Release**

●With the door of ice making compartment left open, simultaneously press MODE ◯ and QUICK ◯ for about 3 seconds until a beep sound is heard. The temperature of thermistor disappears and the display gets back to current temperature.

●The function is automatically released one-hour later.

●Follow the procedure above to release this mode. For the prevention of the compressor, avoid releasing it by plugging and unplugging the power cord.

(6) Change mode of compressor rotational speed

Operation sound can be checked by changing the rotational speed of compressor. Always conduct a check while the compressor is operating and the "-" mark is not on the display, which shows the compressor stops. If the "-" mark is on the display, unplug the power cord and then plug it in a few seconds to operate the compressor. Also, this function is not available during the following modes: Child lock, Demonstration, Cooking timer, Thermistor temperature check and error code display.

① **Setting**

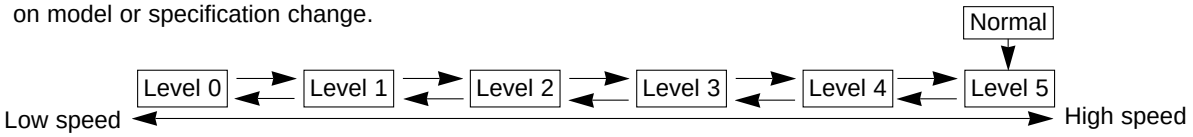
(Ex.) When the rotational speed is 52 rps

●With the door of ice making compartment left open, simultaneously press MODE ◯ and QUICK ◯ for about 3 seconds until a "beep" sound is heard, and "88" blinks.

●Press QUICK ◯ with the door left open.

② **Changing the rotational speed**

●After the setting is complete, press SELECT ◯ and the rotational speed of compressor alternately changes in 6 steps. The rotational speed (rps) is shown on the panel. Basically the compressor starts operating at level 5, however, it depends on model or specification change.



※ Note: Operation sound may get increased in the process of changing the speed, but that does not mean any problem. Check the operation sound when the rotation is stabilized.

③ **ON and OFF of machine chamber fan motor**

Under this function, fan motor in machine chamber can be switched on and off at each press of MODE ◯ switch. The on/off state is shown with ◷ mark on the panel.

Machine chamber fan motor	Display of ◷
ON	Displayed ◷
OFF	Not displayed

④ **Release**

●With the door of ice making compartment left open, simultaneously press MODE ◯ and QUICK ◯ for about 3 seconds until a "beep" sound is heard. The screen returns to the temperature display.

●The function is automatically released one-hour later.

●Follow the procedure above to release this function. For the prevention of the compressor, avoid releasing it by plugging and unplugging the power cord.

(7) Damper Operation Mode

During damper operation mode, the damper is forcibly opened and closed and the state of damper is shown on the panel.

① Setting

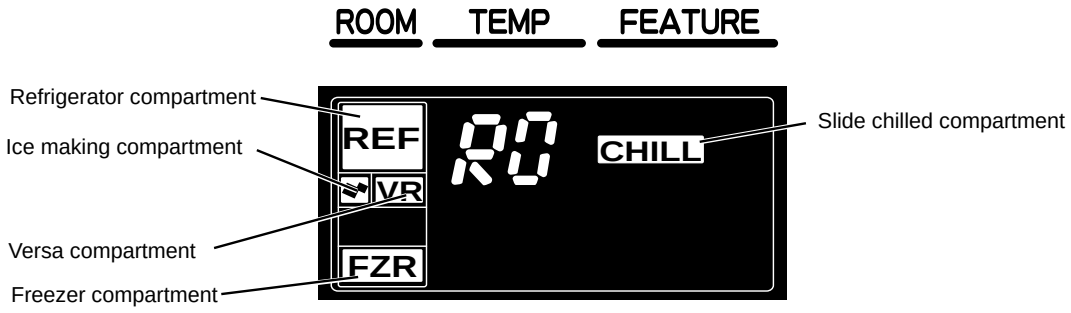
●With the ice making compartment door left open, simultaneously press MODE and QUICK for about 3 seconds until a "beep" sound is heard, and "88" blinks.

●With the door left open, simultaneously press MODE and SELECT for about 3 seconds until a "beep" sound is heard.

② Status display of each damper

Each compartment display turns on when each damper is open and turns off when each damper is closed.

Ex.) When all dampers are open;



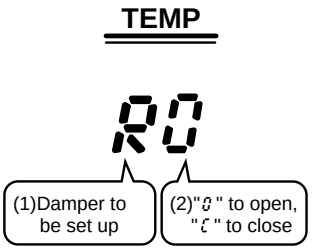
③ How to make each damper open or close

Although the state is shown on the panel, check airflow and confirm the damper is really opened or closed. However, air does not come out when the door is closed, so put a magnet on the door switch to simulate the condition of the door closed.

●Change of display

Kind of damper	Refrigerator compartment	Slide chilled compartment	Ice making compartment	Versa compartment	Freezer compartment
Display	R	C	I	S	F
	(R)	(C)	(I)	(S)	(F)

(Ex.) When making the damper of refrigerator compartment open



(1)Press SELECT to select the damper to be set up.
A "beep" sound is heard and the kind of damper is changed every time SELECT is pressed.

→Refrigerator compartment → Slide chilled compartment → Ice making compartment →
Versa compartment → Freezer compartment →

(2)Press QUICK to "0" to open the damper or "C" to close the damper.

(3)Press ECO for about 3 seconds to convey the setting to the damper.
A"beep"sound is heard if the setting has been conveyed.
After the setting is conveyed, the damper starts operating and the display blinks. It stops blinking and starts to light when the operation stops automatically. Please note that the setting cannot be changed when the damper is operating.

As the damper of slide chilled compartment opens and closes in conjunction with the damper of refrigerator compartment, it is necessary to set them to the either of the following.

R	C	How to set
Open	Open	Set R to 0 and then set C to 0.
Close	Open	Not available
Open	Close	Set R to 0 and then set C to C.
Close	Close	Set R to C.

④ Release

●With the door of ice making compartment left open, simultaneously press MODE and QUICK for about 3 seconds until a "beep" sound is heard. The screen returns to the temperature display.

●This function is not automatically released.

●Follow the procedure above to release this function. For the prevention of the compressor, avoid releasing it by plugging and unplugging the power cord.

(8) Error history display mode

Error history can be observed in the error history display mode.
Use this mode when the actual problem of the refrigerator is different from the error which was displayed at the service-call received.

① Setting

●Open the door of the ice making compartment, and press MODE and QUICK together for 3 seconds until a “beep” is heard and and “88” blinks.

●With the door left open, press QUICK and ECO together for 3 seconds until a “beep” is heard.

② Display details

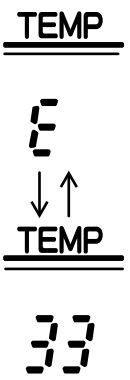
●Same as the error display and trouble locating. (Refer to 6.2(3))

●When there is no recorded error, “ — ” will be displayed.

●When several errors have occurred, error will be displayed in the increasing numerical order, as in the error display and trouble locating.

(Ex.) In case errors in the ice tray thermistor (E10), refrigerator thermistor (E13) and refrigerator fan motor (E31) have occurred:

E → 10 → 13 → 31 → E → 10 → 13 → 31 .....



(Ex.) When there is problem with the ice maker gear box.

③ Check points and resetting the error history

●Follow the treatment procedures shown in the self-check.

●After the treatment, press ECO for 3 seconds to reset the error history.
“ — ” will be displayed when the data is reset successfully.

●Perform the self-check again (Refer to 6.2) to confirm there are no dysfunctions.

④ Release

●Open the door of the ice making compartment, and press MODE and QUICK together for 3 seconds until a “beep” is heard.
The display will return to the normal temperature display.

●Function is automatically released in an hour.

●Follow the procedure above to release this function. For the prevention of the compressor, avoid releasing it by plugging and unplugging the power cord.

Door Buzzer System :

Door buzzer has been installed so that one will not forget to close the door.
When the door of refrigerator compartment or ice making compartment is left open for a minute, the buzzer starts ringing and informs that the door needs to be closed.

When door is left open for:	1 minute- 4 minutes	More than 5 minutes
Buzzer	Buzzer rings every 1 minute	Keeps ringing

The buzzer will stop ringing as soon as the door is closed.

However, this buzzer system does not work when the door is not widely open like when something is pinched between the door and refrigerator.

If the door is not closed completely, the temperature inside the refrigerator will rise and it will be a cause of spoiling the food inside.

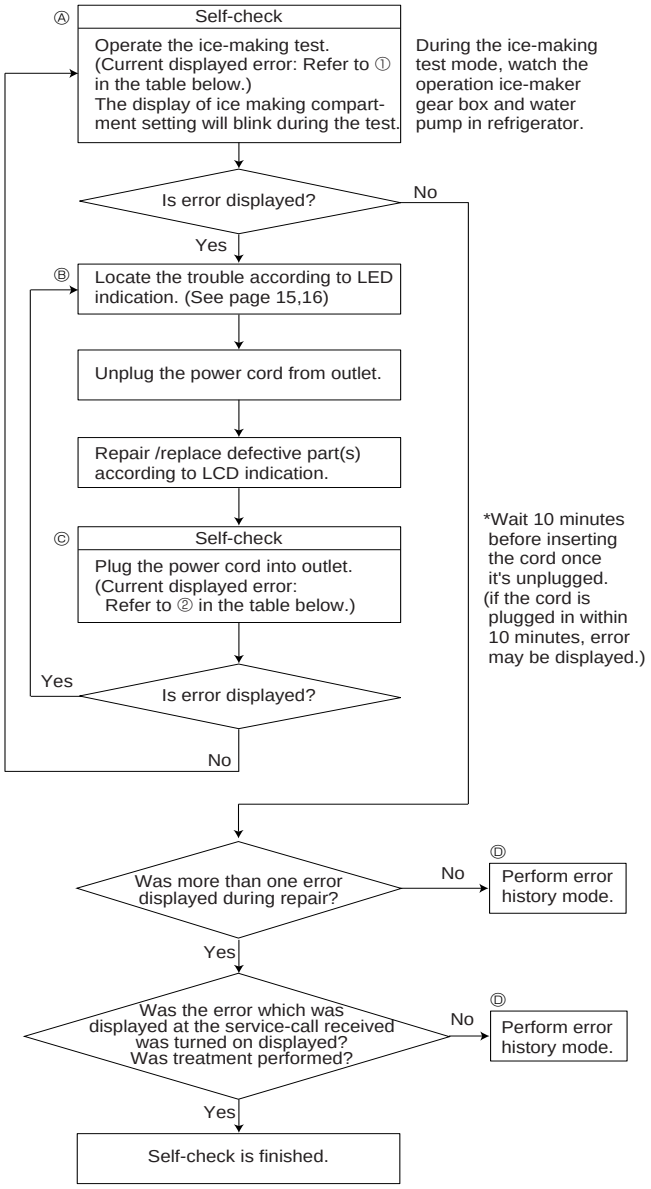
When the buzzer does not stop even if all the doors are closed, abnormality may occur in door switch.
If the buzzer keeps ringing and annoying, it can be stopped by the following operations.

① Perform the ice making test operation.
(Note: If the test is conducted with water in the ice tray, water may fall into the ice storage bin because the tray is rolled over in the ice making operation.)

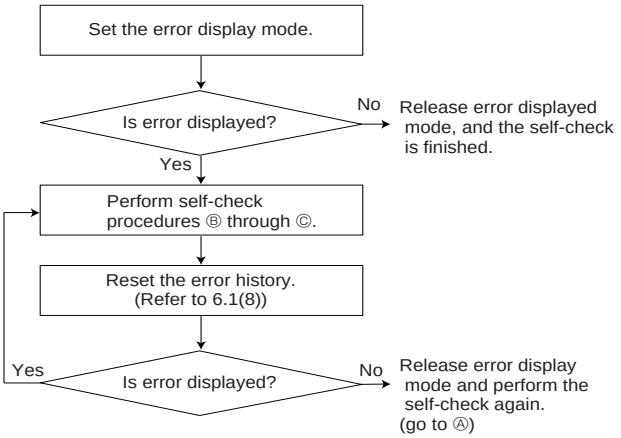
Buzzer sounds when a trouble is found in refrigerator fan motor or in machine chamber fan motor. The buzzer sounds every time the door is closed until the fan motor gets to operate correctly.
(Check the error code by following the steps in Specification of display in self-check result on page 14.)

6-2 FLOWCHART OF SELF-CHECK
MR-G50J-NZ
(1) Troubleshooting with self-check

This refrigerator has self-check feature to clarify and indicate where & what the trouble is.
You can perform operation checks and identify malfunction of electric or electronic parts.
Error history is recorded and can be displayed by the refrigerator.



Ⓓ Error history mode (Refer to 6.1(8))
Problem may recover automatically.
Perform the following if error is not displayed before treatment or the error which was displayed at the time power of the unit was turned on is not displayed.



Note1: Self-check cannot detect abnormalities in the following parts.
See page 19-31 for troubleshooting.
Door switch
Motor damper
Heater (Water pipe / Vegetable compartment heater, etc.)
Water pump motor

Note2: If any abnormality is found when switch is turned on, compressor and fan motor are suspended for 10 minutes.

Note3: The alarm beeps when some abnormalities (motor-locked) have occurred at the refrigerator fan motor restarts its normal operation.

Note4: If any abnormality occurs in compressor's inverter circuit, the compressor and the refrigerator fan motor stop for 10 minutes (not only when plugging the power cord).

●Self-check and error display method and operation

	Item	Operation method	Display or self-check operation	Display time	Others
Self-check (current displayed error)	①Ice making test operation. All items except (*6) listed up on the table at page 17 will be checked.	Press the MODE switch. for 5 seconds.	1.Conduct the automatic ice making test. (The display of ice making compartment setting is blinked) 2.When trouble is found, all error codes except E50-E55 are displayed. 3.When error is not found, nothing is displayed.	For 10 minutes after setting.	Self-check is not available during child lock, cooking timer, changing the rotational speed of compressor, checking the temperature of thermistor, damper operation and demonstration modes.
	②Power input. All items except (*6) listed up on the table at page 17 will be checked.	Plug the power cord into outlet.	1.When trouble is found, all trouble except E50-E55 and displayed. 2.When error is not found, nothing is displayed.	For 10 minutes after power is supplied.	Self-check is not available during demonstration mode.
Display error history.	③Error history	Refer to 6.2(3) Error history display mode.	1.When trouble is found, all trouble except E50-E55 and displayed. 2.When error is not found, nothing is displayed.	For one hour after setting, or until mode is released.	Self-check is not available during child lock, cooking timer, changing the rotational speed of compressor, checking the temperature of thermistor, damper operation and demonstration modes.

●Release of self-check display mode
self-check finishes automatically. Error cord display is automatically released 10 minutes later.

(2) Timing in self-check

Trouble of Defrost heater : Self-check is conducted after defrosting.
(Make sure to confirm the display before unplugging the power cord because it is automatically reset once the power cord is pulled out.)

Trouble of Ice maker : Press the MODE switch on the panel for 5 seconds. (Ice making test mode.)
The setting of ice making compartment blinks on LCD during the test operation.

Trouble of Fan motor : Open the door and then closed it.
When abnormality is found in fan motor, buzzer sound is heard every time the door is closed.

Trouble of Inverter : Check the error when compressor starts up or is operating.

Trouble of Thermistor : Self-check is continuously working

(3) Error display and trouble locating

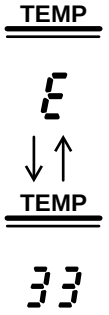
1. Display details

After conducting the self-check by referring to 6-2(1), error codes are displayed in the temperature display section. "E" and two digit error code flashes alternately as shown in the right figure. When several errors occur, they are displayed alternately. However, the error whose code has a smaller number has priority to be displayed first.

(Ex.) In case the errors of ice tray thermistor (E10), refrigerator thermistor (E13) and refrigerator fan motor (E31) are happening simultaneously;

E → 10 → 13 → 31 → E → 10 → 13 → 31 .....

✻ For 2 minutes in self-check, a high-tone sound is heard due to the operation check of damper.



(Ex.) When ice maker gear box is defective.

2. Check point and treatment

Display		Error code		Trouble	Detecting method (*3)	Check point	Treatment	Control
Self-check	Testing	(*1)		Ice maker is under testing				
	LCD	E	01	(*5) Communication error of operation panel	When the following communication errors occur between control board and operation P.C. board: •They transmit and receive data that has nothing to do with settings. •They cannot transmit and receive data each other for about two seconds.	1. Connector CN8K, CN7S on control board 4-pin relay connector (hinge) 4-pin connector on operation P.C. board	Repair the contact failure.	Keep the same operation as the one before the communication error has occurred.
						2. Trouble of control board and operation P.C. board	Replace	
		E	02	Communication error of inverter	When abnormality is found in the communication between refrigerator control circuit and inverter control circuit in control board. (When they do not transmit and receive data for 10 seconds.)		Replace the control board.	Compressor OFF.
		E	03	Trouble of model judgement	When the model of control board is different from the one of operation P.C. board.	1. Check the model name of control board	Replace	Keep operating the unit, and conduct error code indication only.
						2. Check the operation p.c. board.	Replace	
		E	10	Trouble of ice making tray thermistor	When there is a short or open circuit in the ice making tray thermistor.	1. Connector CN7S on control board, Ice gear box 6-pin relay connector, 8-pin relay connector	Repair the contact failure.	When the compartment door has been closed for 3 hours and when freezer compartment thermistor is -10℃ or less, ice-detecting operation starts.
						2. Check the resistance of thermistor.	Replace	
		E	11	Trouble of freezer compartment thermistor	When there is a short or open circuit in the freezer compartment thermistor.	1. Connector CN7S on control board. 6-pin relay connector	Repair the contact failure.	After 10 minutes off, the compressor repeats 30-minute ON and 20-minute OFF.
						2. Check the resistance of thermistor.	Replace	
		E	12	Trouble of defrost thermistor	When there is a short or open circuit in the defrost thermistor.	1. Connector CN7S on control board. 2-pin relay connector	Repair the contact failure.	The defrost heater won't be turned ON.
						2. Check the resistance of thermistor.	Replace	
		E	13	Trouble of refrigerator thermistor	When there is a short or open circuit in the refrigerator compartment thermistor.	1. Connector CN7S on control board, 4-pin relay connector	Repair the contact failure.	Synchronize the open/close status of R damper with that of C damper.
						2. Check the resistance of thermistor.	Replace	
		E	14	Trouble of chilled compartment thermistor	When there is a short or open circuit in the chilled compartment thermistor.	1. Connector CN7S, on control board, 6-pin relay connector	Repair the contact failure.	Synchronize the open/close status of C damper with that of R damper.
						2. Check the resistance of thermistor.	Replace	
		E	15	Trouble of versa compartment thermistor	When there is a short or open circuit in the versa compartment thermistor.	1. Connector CN7S on control board, 6-pin relay connector	Repair the contact failure.	•When S-compartment is used as "freezer": S-damper is open when compressor is turned on, S-damper is closed when compressor is turned off. •When S-compartment is used other than "freezer": S-damper remains open for the first 3 minutes and then closed for the rest of time. S-compartment: Versa(select) compartment.
						2. Check the resistance of thermistor.	Replace	
		E	16	Trouble of vegetable compartment thermistor	When there is a short or open circuit in the vegetable compartment thermistor .	1. Connector CN7S on control board, 4-pin relay connector	Repair the contact failure.	•When R-damper is open, V-heater is turned on. •When R-damper is closed, V-heater is turned off.
						2. Check the resistance of thermistor.	Replace	

Display		Error code		Trouble	Detecting method (*3)	Check point	Treatment	Control
Self-check	LCD	E	17	Trouble of ice making compartment thermistor	When there is a short or open circuit in the ice making compartment thermistor.	1. Connector CN7S on control board, 6-pin, 9-pin relay connector	Repair the contact failure.	•When ice making compartment is used as "refrigerator", synchronize I-damper with R-damper. •When ice making compartment is used as "ice making", synchronize I-damper with F-damper.
						2. Check the resistance of thermistor.	Replace	
		E	18	Trouble of outside air thermistor	When there is a short or open circuit in the outside air thermistor.		Replace the operation P.C. board.	Compressor is activated at "Speed-level 2."
		E	30	Trouble of defrost heater (*6)	When defrosting is not finished in 2 hours.	1. Connector CN2A on control board Defrost heater plug and receptacle, 1-pin relay connector Thermal fuse 4-pin, 8-pin relay connector	Repair the contact failure.	The defrost heater is stopped and if the next defrosting finishes in 2 hours, the error code will disappear .
						2. Check the resistance of defrost heater.	Replace	
						3. Check the continuity of thermal fuse.	Replace	
		E	31	Trouble of refrigerator fan motor	•When motor doesn't rotate even though power is on. •When the waveform, which indicates the rotation times of motor, cannot be detected.	1. Connector CN4D on control board, Refrigerator fan motor 6-pin relay connector	Repair the contact failure.	•3 minutes later, the refrigerator fan motor is reactivated to be checked. •Until the fan motor gets to operate correctly, the buzzer sounds every time the door is closed.
						2. Check refrigerator fan motor operation.	Replace	
		E	32	Trouble of machine chamber fan motor	•When motor doesn't rotate even though power is on. •When the waveform, which indicates the rotation times of motor, cannot be detected.	1. Connector CN4D on control board, 4-pin connector, 4-pin relay connector	Repair the contact failure.	•3 minutes later, the machine chamber fan motor is reactivated to be checked. •Until the fan motor gets to operate correctly, the buzzer sounds every time the door is closed.
						2. Check machine chamber fan motor operation.	Replace	
		E	33	Trouble of ice maker gear box	When the gear box operation is not finished in 30 seconds.	1. Connector CN8K on control board, Ice gear box 6-pin relay connector, 8-pin relay connector	Repair the contact failure.	100 minutes later, the gear box is reactivated to be checked again.
						2. Ice gear box frozen point	Replace	
						3. Check the trouble of the ice gear box with the ice making test operation.	Replace	
		E	34	Clogging of refrigerant pipe or trouble related to compressor	(T0: Defrost thermistor temperature at power input, T1: Defrost thermistor temperature when 15 minutes have passed from the power input) •When the difference between T0 and T1 is T0≦T1. (*5)	Check the compressor and the pipe.		When cooling operation returns to normal condition, the display of error code disappears.
		E	41	Trouble of electromagnetic three-way valve	When defrost thermistor reads -10℃or above in five minutes after the compressor's startup.(*5)	Connector CN9D on control board 5-pin connector in machine chamber	Repair the contact failure.	Check the operation of electromagnetic three-way valve and then open the valve.
		E	50	Trouble of inverter circuit (*6)	•When there is any trouble in the circuit which detects current of compressor.	Refer to "Compressor does not operate" at page 21.		The compressor is suspended and reactivated 10 minutes later.
		E	51	Trouble of bus-bar voltage (*6)	•When the range of bus-bar voltage is not approx. DC 260-390V.			
		E	52	Trouble of inverter software reset function	•When the inverter driving software malfunctions.			
		E	53	Trouble of startup , synchronization or overcurrent detection (*6)	•When there is no current at compressor startup. •When phase current exceeds 5.5A at compressor startup. •When phase current exceeds 3.3A during compressor operation. •When current of 5.3A or more runs into the bus-bar of control board.			
		E	54	Trouble of power supply voltage (*6)	When bus-bar voltage (full wave voltage) is DC 390V or above in power input.	1. Different voltage of power supply outlet	Replace the control board.	Refrigerator compartment room light OFF Heaters. OFF
						2. Trouble of relay in the circuit on the control board		
		E	55	Trouble of control board (*6) (EEPROM related trouble)	EEPROM (IC11M) accumulates data necessary for control. •When the data are not input accurately. •When microcomputer cannot read the data.		Replace the control board.	When abnormality occurs in power input, the compressor is suspended for 10 minutes. When abnormality occurs in normal operation, the compressor keeps operating.
		E	56	Defective wiring continuity or trouble of control board	The errors 50 to 53 keep occurring over one and a half hour. (the situation, which compressor cannot be operated, continues.) Overcurrent detection error occurred before the compressor is activated.	Refer to "Compressor does not operate" at page.22.		•Error display starts after it is regarded as E56. •Error display continues until defrosting starts or cooling operation gets back to normal. (Error display doesn't disappear by unplugging and plugging the power cord.*7) •Try to restart compressor every 3 minutes.

*1 : The setting of ice making compartment will be displayed and blinks during or after ice making test operation.
*2 : This operation is called the recovery operation:
If the damper has not operated ever once during the compressor operation, make the damper operate when the compressor stops.
*3 : When the resistance is ∞Ω, the circuit is deemed open-circuitted.
When the resistance is 0Ω, the circuit is deemed short-circuitted.
*4 : Once E01 is detected, other errors would be ignored and not displayed on the panel.
*5 : Characteristic value may change in order to improve the product.
*6 : The error codes E50 to E55 are not displayed even if those abnormalities occur at power input.
Therefore, be sure to perform ice making test operation in order to check if any abnormality indicated by these error codes occurs. (See page 14.)
*7 : If those errors still continue for 1minute after the restart, E56 will be displayed again.

6-3 BLOCK DIAGRAM OF PRINTED CIRCUIT BOARD

MR-G50J-NZ

Operation P.C. board

- Setting up temperature, feature, quick mode and eco mode for each compartment
- Display of self-check
- Outside air thermistor
- Buzzer

Control board

Control circuit of refrigerator
- Read/control each compartment temperature (Neuro-fuzzy)
- Control on timers
- Operation control of the parts such as fan motor or heater, etc. equipped inside/outside

Inverter control circuit of compressor
- Inverter control of compressor
- Inverter-drive power module
- Detection of bus-bar voltage

Parts outside/inside of Refrigerator

For 325V system
- Compressor

For 230V system
- Defrost heater
- Vegetable compartment heater 1&2
- Rotational heater board
- Divider heater (I/S)
- Water pipe heater
- Refrigerator compartment room light
- Ice making tray heater

For 12V DC system
- Refrigerator fan motor
- Machine chamber fan motor
- Motor damper
- Ice maker gear box
- Three-way valve
- LED for vegetable compartment.
- LED for bacteria removal from water tank

For 5V DC system
- Freezer compartment thermistor
- Refrigerator compartment thermistor
- Defrost thermistor
- Slide chilled compartment thermistor
- Door switch (For refrigerator compartment & ice compartment)
- Ice tray thermistor
- Ice making compartment thermistor
- Vegetable compartment thermistor
- Position-specifying switch in ice maker gear box
- Versa compartment thermistor

6-4 AUTO ICE MAKER

MR-G50J-NZ

(1) Ice making cycle

Water supply

The ice tray is filled with water from the water tank.

Ice making

Ice tray thermistor watches and controls the ice making operation.

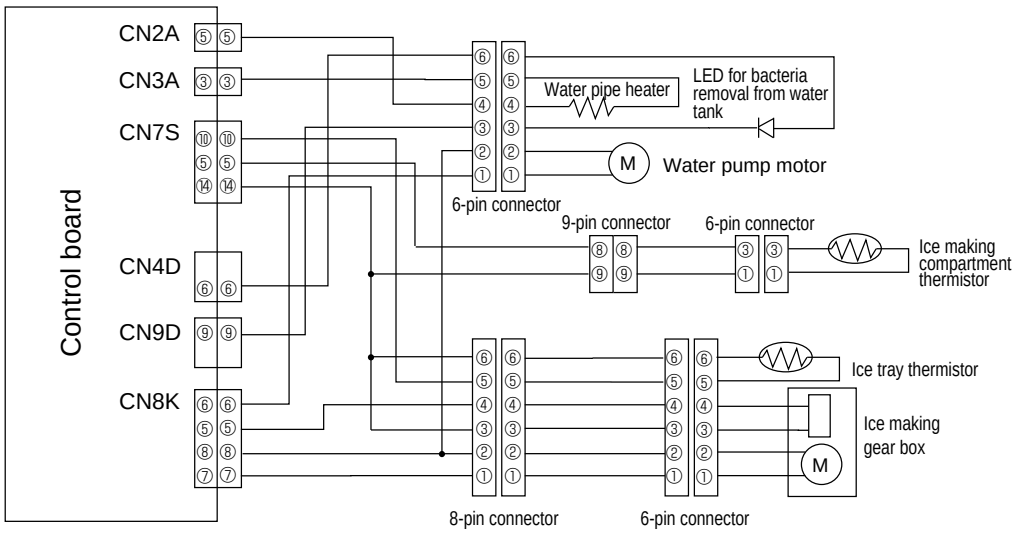
Ice ejection

After the detection lever checks the amount of ice, the ice tray is rolled over for ice ejection.

Ice stock

Ice is stocked in the ice server.
Ice making capacity is about 100 - 120 cubes a day.
Stock capacity of Ice cubes is about 100 cubes.

(2) Automatic ice maker circuit



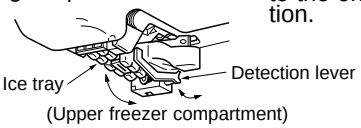
(3) Operation by ice making test

Press the MODE switch for 5 seconds or more. (See "• Self check and error display method and operation, ① Ice making test operation" at page 14.)

Ice making test completes about 20 seconds later.

→ Ice stock detective lever detects the amount of ice.

Detective lever once come down to detection point then return to the original position.



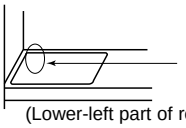
(Upper freezer compartment)

→ The ice tray is rolled over and the system is reset.

The ice tray rolls over once to drop the ice, then return to the original position.

→ Water pump motor is operates.

Remove the lid of the water tank then check the sounds of water running.



Check here.
(Lower-left part of refrigerator compartment)

→ Completion

When abnormality occurs, the error code is displayed on the panel.
Inspect the abnormal points by referring to page 15, 16.

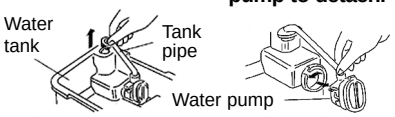
[Check point of automatic ice maker operation]

*Never touch the automatic ice maker while it is operating.
After the operational test, a popping sound is heard several times because the operation of three-way valve is checked automatically. During the operation, do not insert a hand into the automatic ice maker.

(4) Maintenance for water pump and water pipe

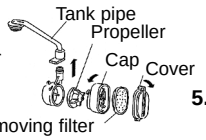
Water pump & Light-type bacteria removing filter

1. Pull out the pipe. **2. Turn the tank pump to detach.**



3. Pull out the tank pipe, turn the cap to remove, and then wash the propeller with water.

•The propeller is made of the magnet. Wash it well with water so that no alien substance remains on it.



Light-type bacteria removing filter

4. Remove the light-type bacteria removing filter and wash it in water.

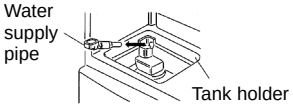
Normally the filter need not be replaced. However, replace it in the following condition:
•When the filter is clogged by passing something other than water through the filter.
•When the filter is broken.
In such a case, contact the dealer that you purchased this refrigerator.

5. Put the parts back in the reverse order of disassembly.

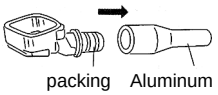
Water pipe · Tank holder

1. Pull out water supply pipe. Wipe the tank holder with clean cloth.

•Do not let water flow into the tank holder.

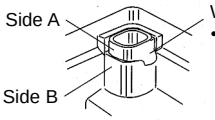


2. Separate pieces and wash with water.



•Twist the aluminum pipe to replace it.

3. Reverse steps to replace the pipe.



Water pipe
•Replace the water pipe. Be sure that sides A and B fit flush to each other.

(5) Troubleshooting for automatic ice-maker

Trouble with ice-making	Water or ice is on the ice tray	The ice does not come out from the tray	The ice-maker gear box may be defective, cooling may be poor or ice cubes may be full in the server.		
			1.Check inside of the ice server.	•Ice cubes are not stored flatly and the amount is detected as full. •Food inside the ice server	→Inspection
			2.Measure the resistance of ice tray thermistor circuit.	•Open circuit (∞Ω) or short circuit (0Ω)	→Replace the ice tray thermistor.
			3.Check if the temperature of the freezer compartment is cool enough. (It takes longer to make ice during summer time or if the door is frequently opened.)	•Not enough	→Poor cooling
	No water or ice in the ice tray		The water saucer may be defective, or the ice tray may get cracked.		
		Water in water saucer	4. Check the water pipe between the refrigerator compartment and freezer compartment for dirt, and foreign objects.	•Clogging •Freezing (For freezing, check the pipe heater resistance.	→Clean the water pipe. →Defrost
		No waterdrops in water saucer	5.Check the condition of ice tray.	•Broken or cracked •Not placed properly	→Replace the tray. →Reinstall it properly.
			6.Disassemble the water pump and check the inside of the pipe.	•Dirt or foreign objects	→Repair and explain to the user for proper usage.
			7.Tank pipe is clogged , has a hole or is not properly installed.	•Clogging, disconnecting •Hole or crack	→Clean / Reinstall it properly. →Change the tank pipe.
			8.Check the motor coil resistance.	•Open or short circuit	→Check the water pump.
			9.Check if there are any dirt or foreign object which are difficult to remove in the water tank. Also, check if there is any crack or deformation on the tank.	•Crack or deformation	→Change the water tank.
Water in the tank holder			10.Check the water pipe for dirt, and foreign objects. Also, check the water pipe position and connection.	•Clogging, disconnecting •Hole or crack	→Clean / Reinstall it properly. →Replace the pipe.
			11.Check the water pipe (between F.compartment and R.compartment) for clogging.	•Clogging	→Clean / Remove the dirt.
Chained ice, Water leaking from the ice server			12.Check the water pump operation by the ice-making test.	•Water filling time is longer than 9 seconds.	→Replace the control board.
			13.Water spill at the installation of water tank or more water over the full water level may cause to from chained ice.		
			14.Measure the water pump coil resistance.	•Open or short circuit	→Change the water pump motor.

6-5 FLOWCHART OF TROUBLE CRITERION

MR-G50J-NZ

[1] Refrigerator compartment/ Slide chilled compartment

Excessive cooling

Are the temperatures of refrigerator compartment/ set to "Low"?
- No → Set the temperatures to "Low".
- Yes → Only food around the air blowing part get frozen
  - Yes → Keep the food away from the blowing part
  - No

No cooling, poor cooling

Are the temperature of refrigerator compartment/ set to "High"?
- No → Set the temperatures to "High".
- Yes → Open the refrigerator compartment door with a magnet on the door switch to check that cold air blows from the outlet.
  - No → Proceed to [5] at page 23.
  - Yes

Expose the damper (for refrigerator compartment/ slide compartment) so that its operation can be visibly checked and conduct an ice-making test. Does the baffle open/close ? (Wait 1 minute for self-check).
(See "Self check method and its operation,① Ice making test operation" at page 14.)
- The baffle does not operate → Replace the motor damper (for refrigerator compartment/ slide chilled compartment)
  ✵**Motor damper is combined with control panel assembly.**
- Normal

Is the motor damper (for refrigerator compartment/ slide compartment) covered with frost?
- Yes → Repair the frosted part.
- No

Check the refrigerator compartment thermistor

Put refrigerator compartment thermistor into ice water (0℃), disconnect the 4-pin connector, and measure resistance between ③ (white) and ④ (white). •Resistance at 0℃ :approx. 6-7kΩ.

Refrigerator compartment thermistor abnormal → Replace the refrigerator compartment thermistor

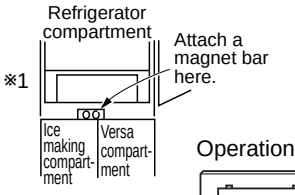
Check the chilled compartment thermistor

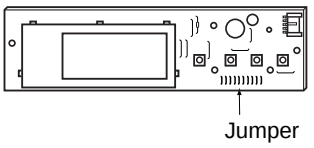
Put chilled compartment thermistor into ice water (0℃), disconnect the 6-pin connector, and measure resistance between ③ (white) and ⑥ (white). •Resistance at 0℃ :approx. 6-7kΩ.

Chilled compartment thermistor abnormal → Replace the slide chilled compartment thermistor

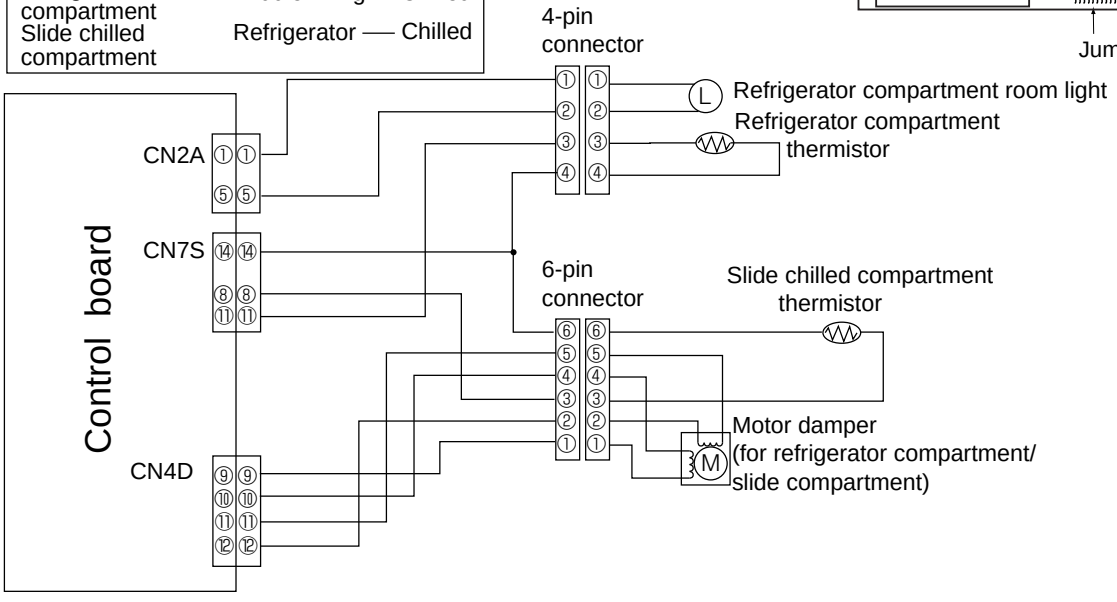
Cutting jumper wires on operation P.C. board can change the set temperature of each compartment. Unscrew the back of operation p.c. board and remove decoration panel to cut the jumper wires.

	Freezer compartment	Refrigerator compartment	Slide chilled compartment	Slide chilled compartment	Versa compartment	Ice making compartment
Jumper to be cut	JP1	JP2	JP3	JP4	JP5	JP6
Temperature change	1℃ lowers	1℃ lowers	1℃ highers	2℃ lowers	1℃ lowers	1℃ lowers





Weak ← Cooling → Strong
Refrigerator compartment: Low – Middle – High – Chilled
Slide chilled compartment: Refrigerator — Chilled



[2] Freezer compartment

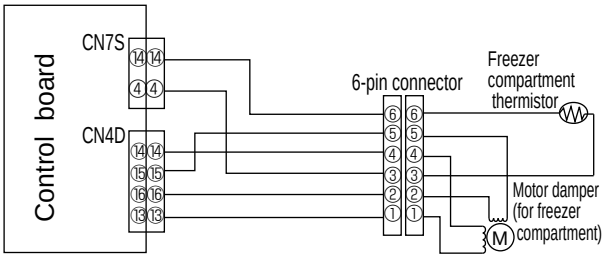
Poor cooling

1 Is the set temperature of freezer compartment set to “High”?
- No → Set the temperature to “High”.
- Yes ↓

2 Does cool air come out of air outlet?
- No → Proceed to “The refrigerator fan motor does not work.”
- Yes ↓

3 Operate the ice-making test at the place where the operation of dampers (Refrigerator compartment and slide compartment thermistor) is visible. Does the baffle open / close? (Wait 1 minute for self-check).
(See “Serf-check and error display method and operation, ① Ice making test operation” at page 14.)
- The baffles do not function. → Replace the motor damper (for freezer compartment).
  ※Replace the fan grille as well as the motor damper since they are combined together.
- Normal ↓

4 Check freezer compartment thermistor.
Dip freezer compartment thermistor into ice water (0℃), and measure the resistance between terminal ③ (white) and ⑥ (white) by detaching 6-pin connector at the left-back bottom of vegetable compartment.
•Resistance at 0℃ :approx. 6~7kΩ.
- Normal → When compressor operates, LCD indicates E41 as a result of self-check. → Exchange the unit
- Defective thermistor → Replace freezer compartment thermistor



[3] Compressor does not operate

Not cooling at all(In case any error codes doesn't appear as shown in page 21,22 even though mode switch is pressed for 5 seconds)

Is refrigerator in the demonstration mode?
- Yes → Release the demonstration mode. (See page 10.)
- No ↓

Does AC 230V run between ① and ③, terminals of CN1 on filter board?
- No → Inspect power-supply wiring such as power cord and breaker etc.
- Yes ↓

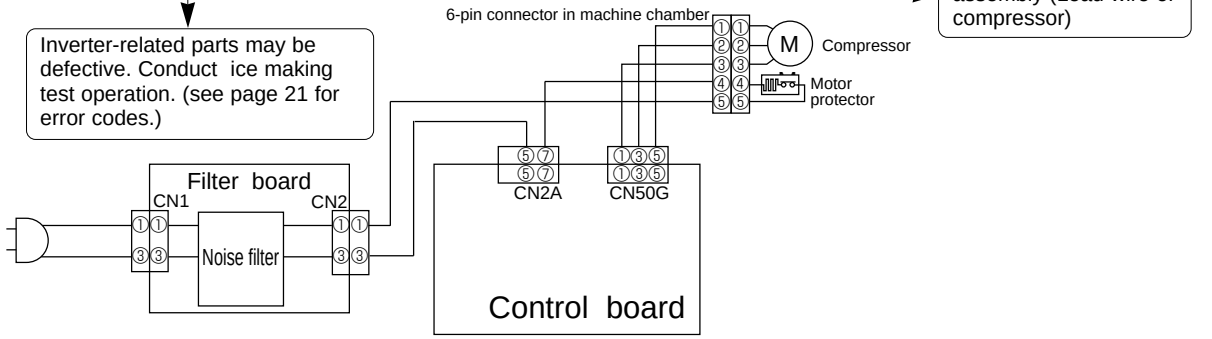
Does AC 230V run between ③ and ⑤, terminals of CN2 on filter board?
- No → Replace the filter board.
- Yes ↓

Detach each connector CN2A on control board check the continuity between terminals ⑤ and ⑦ respectively.
(Check if there is a short or open circuit in the motor protector.)
- No continuity → Motor protector (open circuit)
  ※By measuring the resistance, ensure that the circuit is open.
- Continuity detected ↓

Detach connector CN50G on control board and check the resistance respectively between terminals of ①,③ and ⑤:approx.9.3Ω
- No continuity → Disconnect 6-pin connector in machine chamber to check resistance between terminals of ①, ② and ③: approx.9.3Ω
  - Normal → Check connector contact.
  - Abnormal ↓
- Continuity detected ↓

Check the error display of self-check after turning on and off the power supply.
※With all the connectors connected.
- Measure the resistance of compressor's winding between terminals of black, white, and red : approx.9.3Ω
  - Abnormal → Exchange the unit
  - Normal → Replace the lead wire assembly (Lead wire of compressor)

Inverter-related parts may be defective. Conduct ice making test operation. (see page 21 for error codes.)



Inverter-related indication “Compressor does not operate”

Error code	Abnormality	Possible cause	Symptom	Treatment
E50	Trouble of inverter circuit	•When there is any trouble in the circuit which detects phase current of compressor.	Compressor does not rotate.	Replace the control board.
E51	Bus-bar voltage is abnormal.	•Power supply voltage is abnormal. •Defective reactor on the N/F board	Compressor does not rotate.	E52	Trouble of inverter software reset function	•When the inverter driving software malfunctions.	Compressor does not rotate.	E53	•Abnormal start-up •Abnormal synchronization •Trouble of overcurrent detection	•Compressor motor gets locked. •Defective circuit on control board •Defective contact of CN50G on control board •Defective contact of machine chamber 6-pin connector	Compressor does not rotate.	 *If control board is normal, compressor is energized every 10 minutes. Compressor vibrates at startup when it is being energized. Touch it with your hand to check.

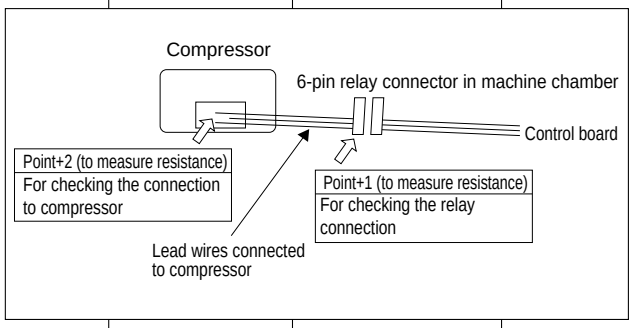
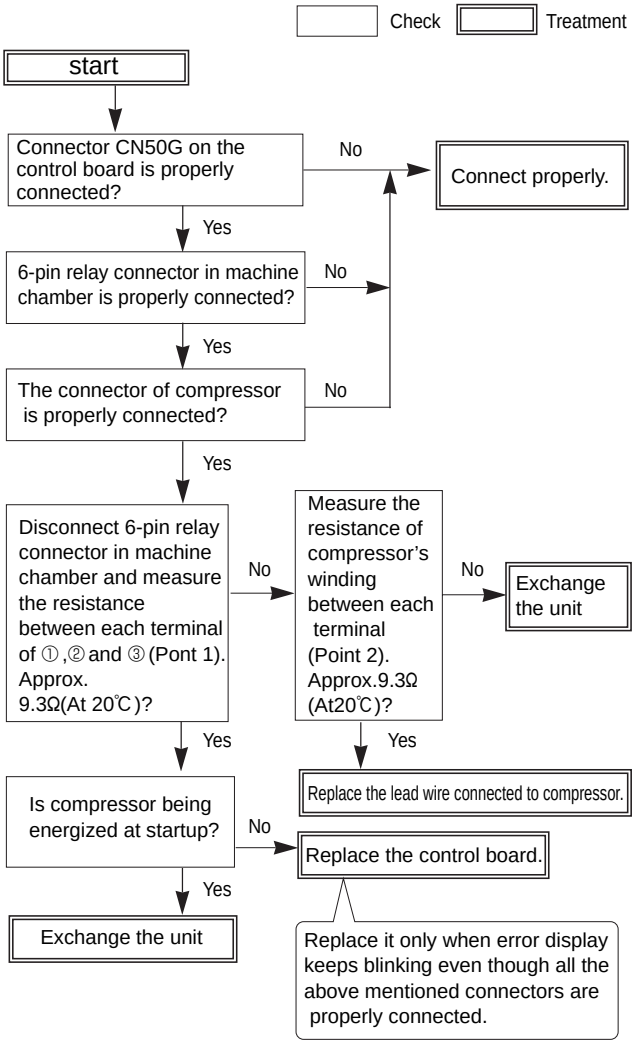
Inverter-related indication “Compressor does not operate”

Error code	Abnormality	Possible cause	Symptom	Treatment
E56	•Defective wiring continuity •Trouble of the control board	•Defective connection of connectors related to compressor (board-side,relay, comp-side) •Defective wiring continuity of the compressor •Trouble of control board •Trouble of compressor	(1) or (2) (1)Compressor can not be activeted for more than 1.5 hours (2)Overcurrent detection error occurred before the compresssor is actived.	1.Locate the trouble and deside the treatment •Decide the treatment by checking the followings. (1) Defective connector connections. (board-side,relay,comp-side) (2) Resistance of compressor’s winding 2.Flowchart of troubleshooting 3.Recheck after treatment •After any treatment is tried, unplug and plug power cord again to check if the compressor operates properly. •If the compressor can operate properly for more than 1 minute after power cord is plugged again, it’s presumed that the couse of trouble is eliminated. *If the couse of trouble cannot be eliminated,”E56” will be displayed again 1 minute later after the power cord is plugged again. *If the control board has been replaced,E56 won’t be displayed even though the couse of trouble is still not eliminated. In such a case,perform the ice making test operation to check what the error is. At the same time, also confirm that the compressor is operating for more than 3 minutes and each compartment is getting cooled.





Poor cooling

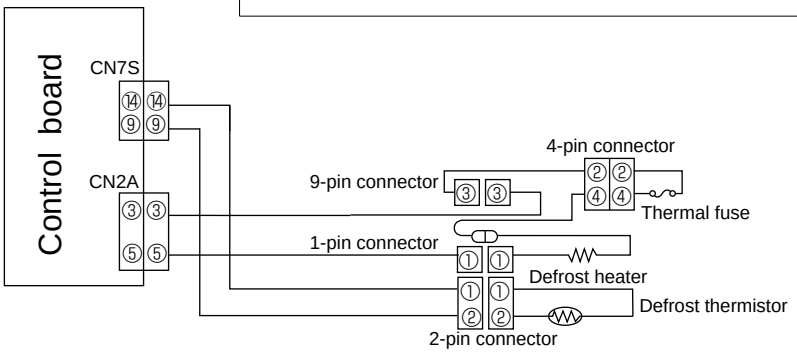
[4] Poor defrosting

1 Short-circuit the terminal ① and ② of the compulsory defrosting terminals (CN1M) of the filter board to actuate the compulsory defrosting function and check whether the defrost heater is working properly. *1

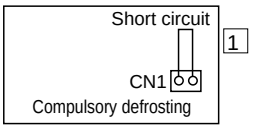
- Yes (heats up) → Check the following: half-open door, space between gaskets, the amount of ice.
- No ↓

2 Check if there is continuity between thermal fuse and defrost heater.

- No → Replace the defrost heater and the thermal fuse.
- Yes → Check the resistance of the defrost thermistor.



<Control board>



*1 The compulsory defrosting will not work when the temperature of the defrost thermistor is 14℃ or more.

[5] The refrigerator fan motor does not work

1 Plug and unplug the power cord to perform self-check on refrigerator fan motor. Is the lamp indicating abnormality?

- Yes → Replace refrigerator fan motor.
  Note: Refrigerator fan motor is combined with fan grille.
- No ↓

2 Plug and unplug the power cord to check if machine chamber fan motor is rotating.

- Not rotating → Check if CN4D connector on control board is connected properly. If it is, replace the control board.
  Room light is not turned on and off.
- Running ↓

3 Check the door switch for continuity.
•Open and close the refrigerator door ⓑ several times and check if the room light will be turned on and off (Room light should get turned off when the door comes 10mm close to the refrigerator body ⓐ.)
•Close the refrigerator compartment door until the light is turned off ⓐ. Open and close the ice-making-compartment door ⓒ, and from the space of refrigerator compatment door, check that the room light is turned on and off.

4 Check the continuity by disconnecting the CN7S on the control board. (See figure below.)

- Abnormal → Contact failure of connector. Connect it properly.
- Normal → Check if the connector on the door switch is connected properly. If it is, replace the door switch.

Room light is turned on and off properly. ↓

5 Check if there is continuity in 6-pin fan motor connector in versa compartment.

- No continuity → Connect the connectors properly.
- Continuity detected → Replace refrigerator fan motor.
  Note: Refrigerator fan motor is combined with fan grille.

Door switch for refrigerator compartment (right and left) and ice making compartment.

Doors	Any one of the doors are open	R-door (right, left): closed Door of the ice making compartment : closed
	 etc	2-Pin connector Between ①and②	OFF	ON

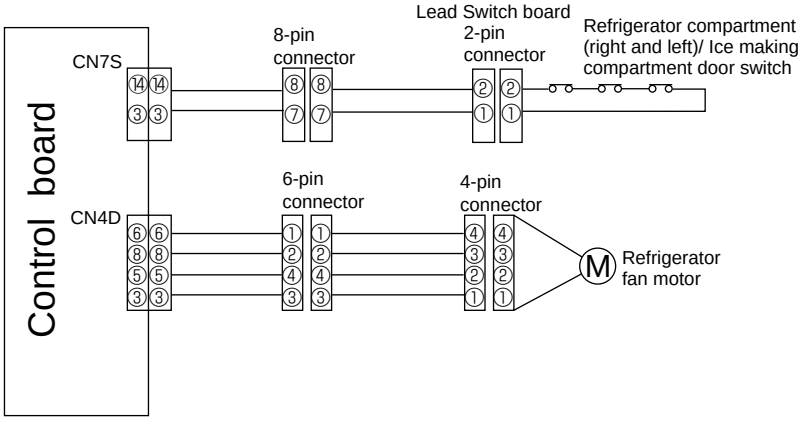
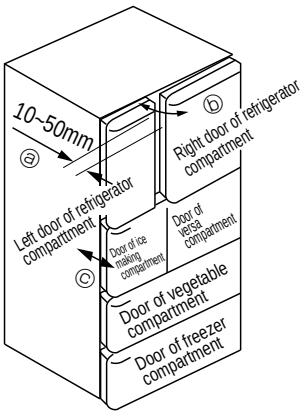
※If any one of those doors are open, the switch between ① and ②,terminals of 2-pin connector, will be OFF)





[6] Vegetable compartment

Excessive cooling

Is the temperature of vegetable compartment set to “Low”?

No → Set the temperature to “Low”.

Yes (Go to ① or ②)

① Check the thermistor, vegetable compartment heater, and control board.

Is one of these error codes indicated when conducting self-check of operation P.C. board?

Refrigerator compartment thermistor: E13
Slide chilled compartment thermistor: E14
Vegetable compartment thermistor: E16
Outside air thermistor: E18

No error code is indicated.

Does vegetable compartment have a resistance of approx. 2.9kΩ between wire-connected terminal ⑤(CN2A) and ⑦ (CN3A) on control board (parallel resistance between vegetable compartment heater 1 and 2)?

0Ω or ∞Ω → It may have contact failure of connector. Recheck the contact after the 6-pin or 2-pin connector is connected.

Yes

E13, E14 or E16 is indicated.

Is there a short or open circuit in each thermistor and is the resistance 0Ω or ∞Ω?

Yes → Replace the defective thermistor.

No → Check the contact of connector connecting each thermistor and connector CN7S on control board. Fix the incomplete contact.

E18 is indicated. → Replace the Filter board.

Is there a resistance of approx. 5.9kΩ between ⑤ and ⑥, terminals of 6-pin connector which is located at the right top of fan grille?

0Ω or ∞Ω → Replace the vegetable compartment heater 1.

Note: Vegetable compartment heater 1 is combined with fan grille.

Yes

When outside temperature is 32℃ or less and compartment temperature is 8℃ or less, set the temperature of each compartment as follows.

Refrigerator compartment:	High
Slide chilled compartment:	Chilled
Versa compartment:	Soft freezing
Freezer compartment:	High

Is there voltage AC230V between connector CN2A ⑤ (Gray) and CN3A ⑦ (Yellow green) on control board?
Measure the voltage for over 10 seconds.
When an analog tester detects AC 230V, consider the control board normal. (230V is outputted on every 10 seconds.)

Yes → Check if doors are hermetically closed.

No → Replace the control board.

Is there a resistance of approx. 5.9kΩ between ① and ②, terminals of 2-pin connector which is located at the left-back bottom of vegetable compartment?

0Ω or ∞Ω → Replace the vegetable compartment heater 2.

Note: Vegetable compartment heater 2 is combined with partition V/ F.

Yes

② Check refrigerator / slide chilled compartment is excessively cooled (poorly cooled).

Follow the refrigerator / slide chilled compartment flowchart on page 19.

OK → Explain proper usage to customer

poor cooling

Is the temperature of vegetable compartment set to “High”?

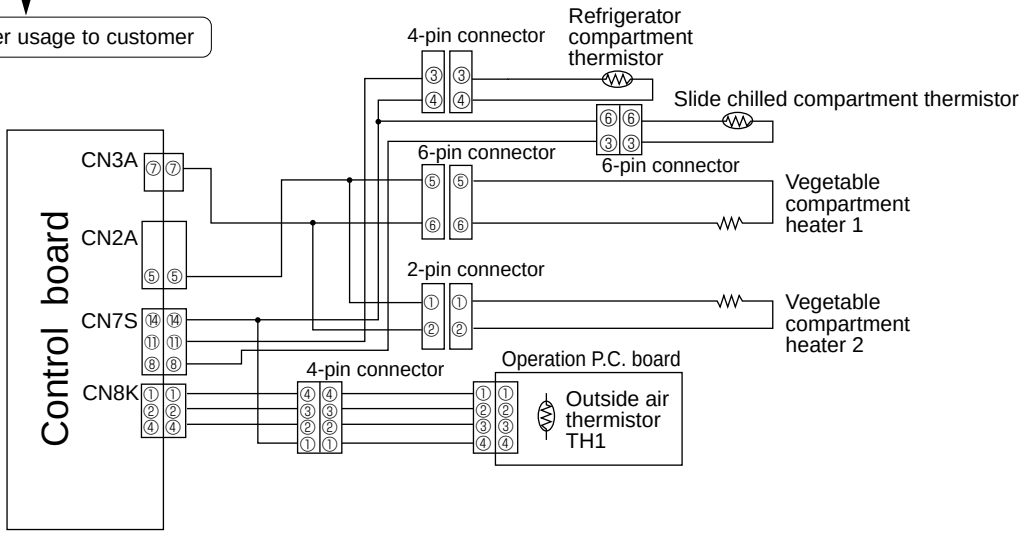
No → Set the temperature to “High”.

Yes

Are the temperatures of refrigerator compartment/ freezer compartment set to “Low”?

Yes → Set the temperatures to “Middle” or “High”.

No (Go to ① or ②)



[7] Versa compartment/ Ice making compartment

only applies to versa compartment.

Excessive cooling

Which operation mode is versa compartment set to?

It is set to “Soft freezing”.

It is set to “Vegetable • Refrigerator” or “Chilled”.

Is the temperature set to “Low”?

No → Set the temperature to “Low”.

Yes

Only the food around cool-air outlet is excessively cooled.

Yes → Keep food away from air outlet in storing food.

No

No cooling; poor cooling

Which operation mode is versa compartment set to?

It is set to , “Vegetable • Refrigerator” or “Chilled”.

It is set to “Soft freezing”.

It is set to “Freezer”.

Is the temperature set to “High”.

No → Set the temperature to “High”.

Yes

Check the set temperature in freezer compartment. Is the temperature set to “High”?

No → Set the temperature to “High”.

※1

Does cool air come out of air outlet when opening the refrigerator-compartment door and attaching a magnet bar on the door switch?

No → Refer to the section: “The refrigerator fan motor does not work”.

Yes

Make the operation of motor damper (for ice making compartment/ versa compartment) visible, and conduct ice making test. Check that the baffles open and close.
(Wait one minute for self-check.)
(See “• Self-check and error display method and operation, ① Ice making test operation” on page 14.)

The baffles do not function

Is connector CN9D on control board connected properly?

No → Connect the connector properly.

Yes

Disconnect CN9D and measure the resistance between ① and ②, and between ③ and ④. Check that the winding of motor damper (for ice making compartment/ versa compartment) has a resistance of approx. 415Ω

0Ω or ∞Ω

Is 6-pin connector which is in connector cover on the back of versa compartment connected properly?
(6-pin connector is connected to motor damper. Refer to the figure below.)

No

Yes

Normal

Replace the motor damper (for ice making compartment/ versa compartment)
※Replace the fan grille as well as the motor damper because they are combined together.

Normal

Is the motor damper covered with frost?

Frosted → Repair the frosted part.

Not frosted

Check the versa compartment thermistor.

Dip the versa compartment thermistor into the ice water (0℃) and disconnect 6-pin connector for fan grille at the back of versa compartment. Measure the resistance between terminal ③ (white) and ⑥ (white).
•Resistance at 0℃: Approx. 6~7kΩ

Defective thermistor → Replace the versa compartment thermistor.

Check the ice making compartment thermistor.

Dip the ice making compartment thermistor into the ice water (0℃) and disconnect 6-pin connector of fan grille at the back of ice making compartment. Measure the resistance between terminal ① (white) and ④ (white).
•Resistance at 0℃: Approx. 6~7kΩ

Defective thermistor → Replace the ice making compartment thermistor.

Components/ Part Name	Check Method and Criterion	Parts Mounted Position
Thermistor	Measure the resistance with a tester according to the following graph. (Thermistor resistance values against temperature) •Resistance measured under the ambient temperature from -50℃ to +50℃ 1. 200Ω to 500kΩ ·····Normal 2. Out of the above range ·····Abnormal  **Thermistor Check Procedure** •Thermistor resistance value will vary with the change of temperature. •Take the temperature around the thermistor, and then measure thermistor resistance using a tester. The relation between resistance and temperature is as shown on the left side. **Troubleshooting with self-check** (1)If the self-check indicates the abnormality of thermistor when the power is turned on, measure the resistance of the thermistor. •If there is a short circuit in the thermistor, there may be a defect in the contact of the connector or the element of the thermistor. (2)When the self-check indicates the abnormality of thermistor a few seconds after the power is turned on, check the contact of the connector.	**Defrost thermistor** Evaporator **Ice making thermistor, Versa compartment thermistor, Vegetable compartment thermistor and Freezer compartment thermistor** In the fan grille of each compartments. **Ice making tray thermistor** In the ice making compartment. **Outside air thermistor** In the operation P.C. board.
Three-way valve	  Model: NSCE001DC1 Normal: 54~56Ω (Gray [common]—Ā/ A/ B̄/ B each phase) Abnormal: Open (∞Ω) or short circuit (0Ω) Check the operation of three-way valve Check the operation by following either (1) or (2) below. When a popping sound is heard 1 to 25 times, it is considered that the valve is operating normally. The sound is clearly heard around the back of the product. (1) Reset the power supply. Check the operation right after this. (2) Ice making test. Check the operation right after the test is over.	In the machine chamber at the rear side of the frame.

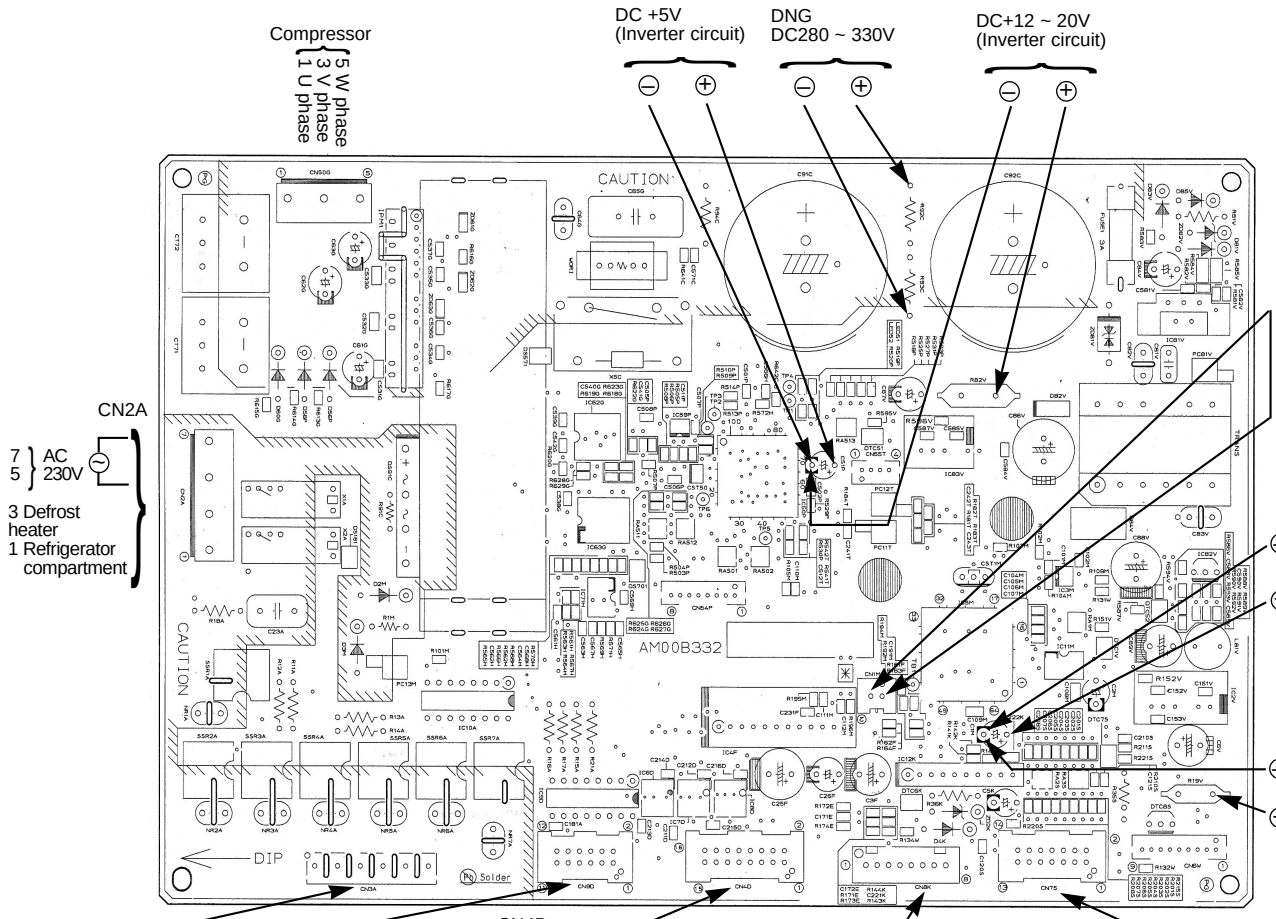
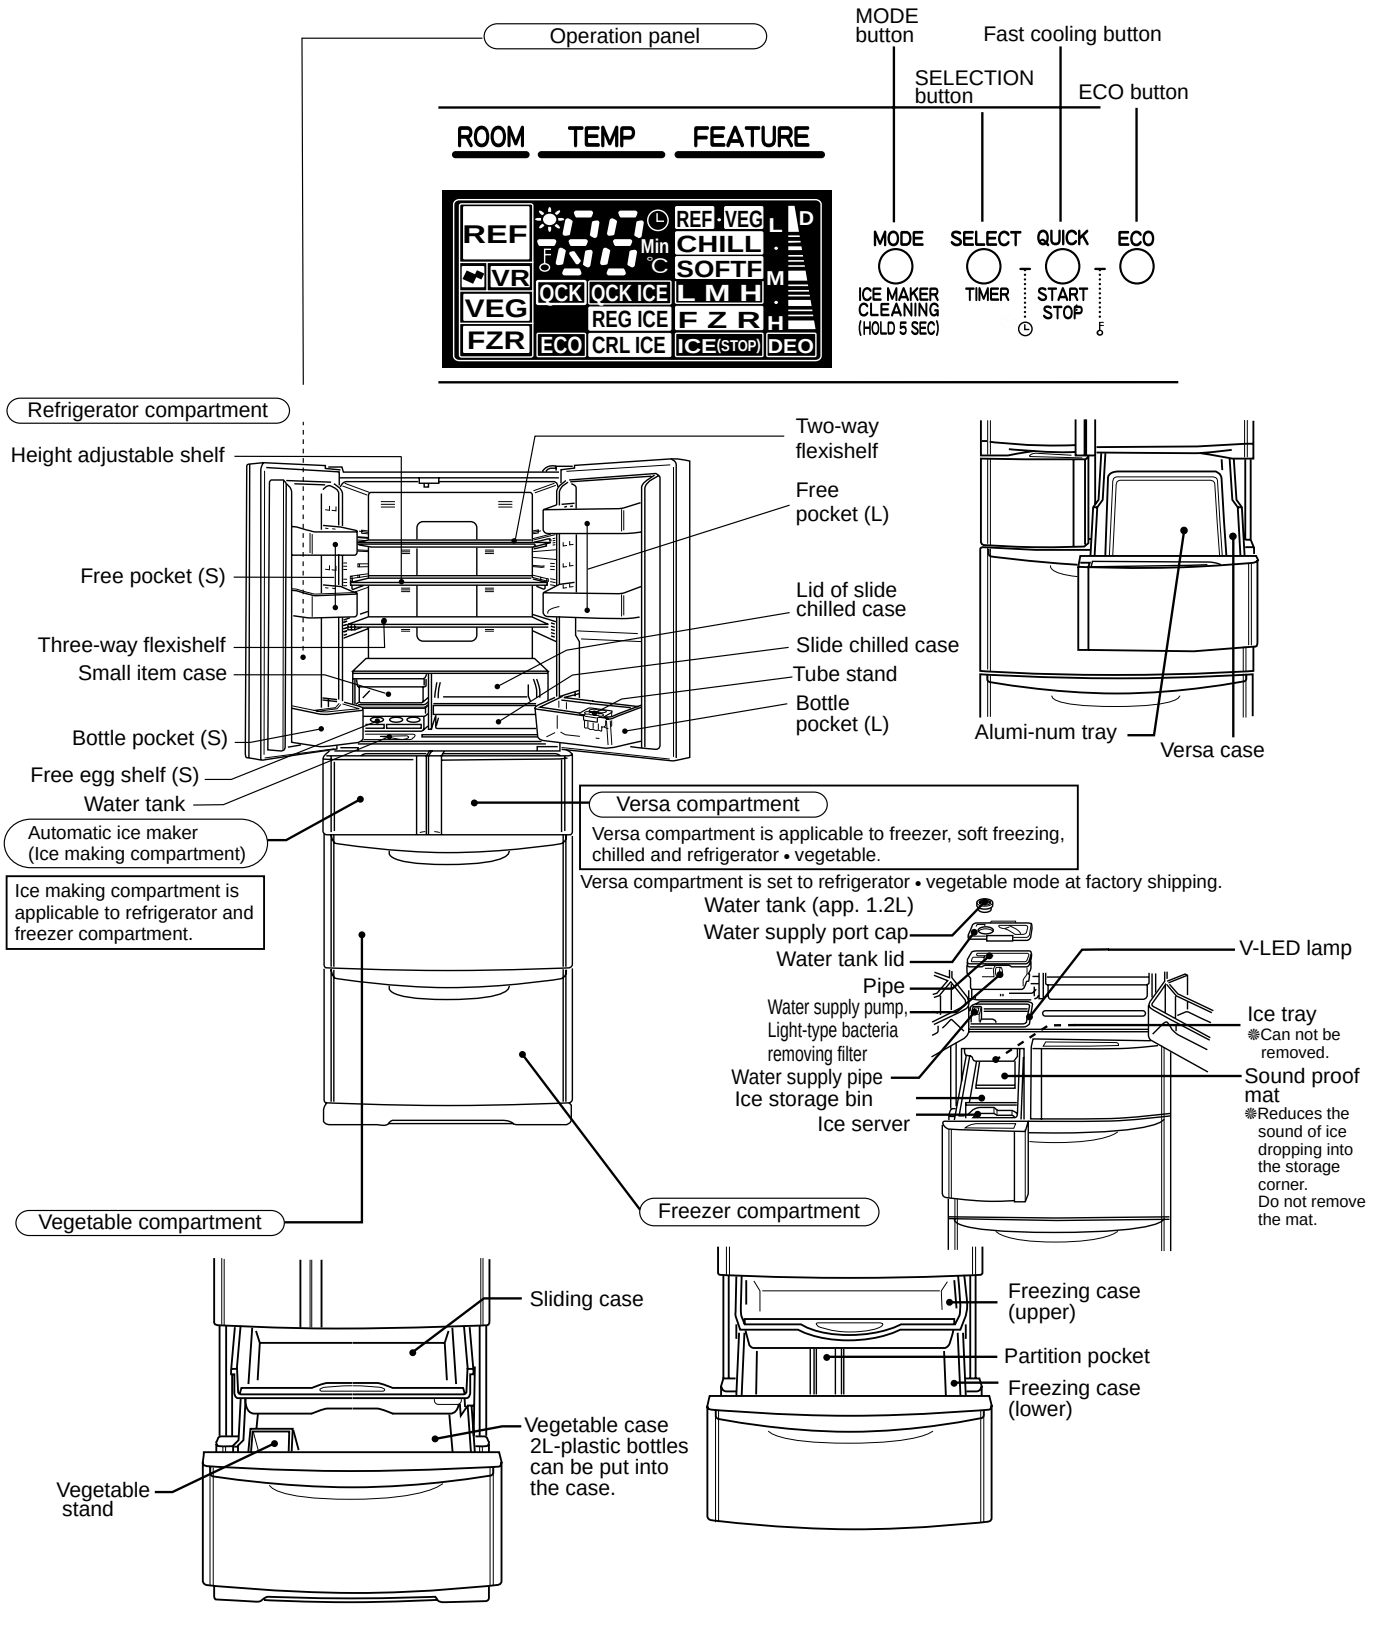
6-8 TEST POINT DIAGRAM OF CONTROL BOARD
MR-G50J-NZ



7 NAMES OF THE PARTS

MR-G50J-NZ



8 DISASSEMBLY INSTRUCTIONS

MR-G50J-NZ

Plug out before work!!
Check the automatic ice-maker pressing ice making stop switch.
In assembling & disassembling parts seven kinds of screws and rivets are used. Do not mistake to use them.

Ⓐ 4X12 Stainless steel
Ⓑ 4X12 (Black) With metal washer
Ⓒ 4X16 (White) With plastic washer
Ⓓ Specified screw
Ⓔ Rivet
Ⓕ Rivet
Ⓖ 5X16 Stainless steel

OPERATING PROCEDURE	PHOTOS
1. Elect cover → Control board (1)Remove 5 screws fixing the elect cover and the rivet Ⓔ on the upper rear side of the refrigerator. (See photo 1) **Control board** (2)Disconnect the connector to remove the control board. **Caution on assembly** Firmly connect the lead wires and the connector. Ensure the wires are not pinched.	Photo 1 2. Parts inside the refrigerator compartment: Vertical partition → Right rail of the slide compartment → Left rail of the slide compartment → Room light cover → Control panel (Upper/ Lower), Duct R (Upper/ Lower) (1)Remove the three way flexishelf, slide chilled case, and height adjustable shelf, two way flexishelf from the refrigerator compartment. **Vertical partition** ①Remove the small item case and the slide chilled case. ②Pull out the ceiling by unhooking the front catches on both sides. ③Remove the slide chilled case lid. ④Remove the vertical partition.  **Right rail of the slide compartment** (2)Slide the right rail out toward you. (See photo 2) **Left rail of the slide compartment** (3)Remove screw Ⓖ (one screws),and slide the left rail out toward you. (See photo 3) **Room light cover** ①Push up the lower catch, and pull the room light cover toward you. ②Detach two upper catches to take out the cover. (See photo 4)	Photo 2  Photo 3  Photo 4 
OPERATING PROCEDURE	PHOTOS
Control panel (upper/ lower) Duct R (upper/ lower) (4)Remove rivet Ⓔ, and pull out the mirror hinge on the lower left of the control panel to remove the connector. (See photo 5) (5)Remove rivet Ⓕ (two rivets) in the upper left and right side, screw Ⓐ (two screws) in the lower left and right side, and rivet Ⓕ (two rivets) in the lower. left and right side. Detach catches (seven places). (See photo 5) (6)Detach catches (six places) on control panel (upper/ lower) and then duct R (upper/ lower). ※ Control panel can be divided into the upper and lower part by detaching catches (three places) on control panel (upper/ lower) **Control panel assembly** (The assembly consists of the following: Control panel [upper/ lower], motor damper for refrigerator compartment / slide chilled compartment, refrigerator compartment thermistor, slide chilled compartment thermistor, room light socket, refrigerator compartment room light, and duct R [upper/ lower]). **Caution on assembly** To prevent poor contact of connectors, connect them properly. Fix the control panel by inserting the lower catches (two places) into the floor of refrigerator compartment.	Photo 5 3. Parts inside the ice making compartment, versa compartment, vegetable compartment, and freezer compartment ➔ Partition I/ S ➔ Partition I/ S/ V ➔ Cover (IM) ➔ Automatic Ice maker assembly ➔ Cover (lower) ➔ Partition V/ F ➔ Connector cover (right/ left) ➔ Fan grille ➔ Defrost heater, Drip tray, DEF thermistor (1)Remove interior parts out of ice making compartment, versa compartment, vegetable compartment, and freezer compartment. (2)To detach them, pull out the doors of ice making compartment, versa compartment, vegetable compartment, and freezer compartment. **Partition I/ S** (3)Remove rivet Ⓔ (one rivet), partition cover, and a connector. Remove screw Ⓒ (two screws) at the front side of refrigerator and four rollers to pull out the partition. (See photo 6) **Caution on assembly** Push up the lead wires so that they will not rub partition I/ S. **Partition I/ S/ V** (4)Remove screw Ⓐ (two screws) at the front of refrigerator. Remove screw Ⓐ (one screw each) and screw Ⓓ (one screw each) at the right and left side of inner wall. Then lift up the partition. (See photo 7) **Cover (IM)** (5)Remove 2 rivets Ⓔ and 3 catches in order to detach the cover. (See photo 8) **Automatic ice maker assembly** (6)Pressing a catch upward, and pull Automatic Ice maker assembly to the right side. (See photo 8)	Photo 6  Photo 7  Photo 8 
OPERATING PROCEDURE	PHOTOS

Cover (lower)

(7)Remove rivet Ⓔ (one rivet) to detach the cover (See photo 10)

Partition V/ F

(8)Remove screw Ⓐ (four screws) on inner wall and screw Ⓐ (two screws) at the front.
Detach three connectors and lift up the partition. (See photo 9)

Connector cover (right/ left)

(9)To detach connector cover, remove rivet Ⓔ (two rivets each) and catches (two places).
(See photo 10)
(10)Detach the connector.

Fan grille

(11)To detach fan grille, remove screw Ⓑ (two screws) of right and left side and remove upper catches (three places).
※Fan grille consists of the following: motor dampers (for ice-making compartment/ versa compartment, and freezer compartment), refrigerator fan motor, fan, thermal fuse, vegetable compartment heater 1, four thermistors, vegetable compart ment LED.
(See photo 10)

Defrost heater , Drip tray

(12)To pull out defrost heater, remove the tape fixing lead wires and push up the catches of evaporator support.
Remove heater roof out of defrost heater.
To detach drip tray, remove aluminum tape first.
(See figure 1)

Defrost thermistor (DEF thermistor)

(13)Cut the binder and disconnect the connector to remove the DEF thermistor and the thermal fuse. (See photo 11)

Caution on assembly

Attach defrost heater in place and loosen the lead wires in order to prevent water from entering the glass tube.
Attach the drip tray securely to the lower parts.
Attach the DEF thermistor in place. (If they are attached out of place, thermal characteristics will go wrong.)
Attach the lead wires to the fixture.

Photo 9

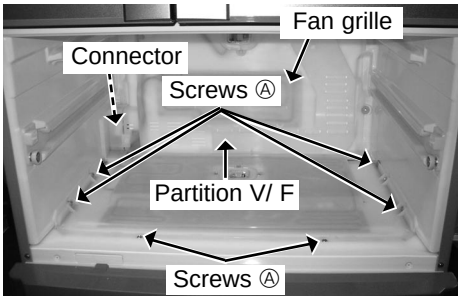

Photo 10

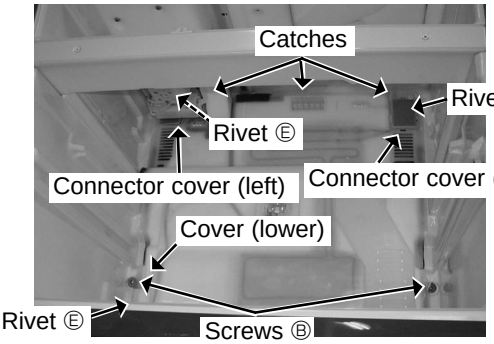

Fan grille

(Fan grille consists of the following: motor dampers (for ice making compartment / versa compartment, and freezer compartment), refrigerator fan motor, fan, thermal fuse, vegetable compartment heater 1 four thermistors, vegetable compartment LED).

Figure 1

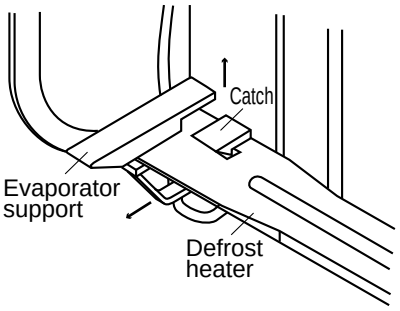

Photo 11

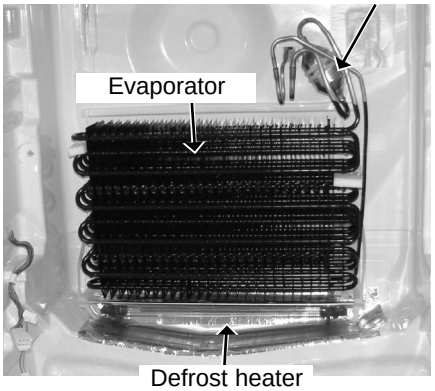

OPERATING PROCEDURE	PHOTOS
4. Parts inside the refrigerator compartment → Left rail of the slide compartment → Parts inside the ice making compartment → Ice making compartment door → Tank holder → Door switch (1)Remove the parts inside the refrigerator compartment. (See procedure [2]) (2)Remove the left rail of the slide compartment. (See procedure [2]) (3)Remove the parts inside the ice making compartment. (See procedure [3]) (4)Remove the ice making compartment door. **Tank holder** (5)Remove a screw on the side of the refrigerator compartment. (6)Remove label and screw Ⓐ (two screws). Pull the tank window. (7)Loosen screw Ⓐ (three screws) halfway on the side of the ice making compartment. Put a screwdriver on the head of each screw and top the bottom side of the holder softly to detach it. (See photo 12) (8)Lift up the tank holder from the refrigerator compartment to remove it. **Note:** ①Put the lead wires in place so that they do not get caught in water supply channel. ②Put the tank holder in place so that the water does not leak from it. **Door switch** (9)Insert a minus screwdriver between switch and body to remove the door switch.	Photo 12  Figure 2 5. Parts inside the versa compartment → Ceiling of versa compartment (1)Take out interior parts of versa compartment. (2)Lift up and pull out the versa-compartment door. **Ceiling of versa compartment** (3)To detach the ceiling, remove rivet Ⓕ (three rivets) and pull down the ceiling. (See photo 13) **Caution on assembly** ①Be sure that all the parts are fitted securely in place.	Photo 13 
OPERATING PROCEDURE	PHOTOS
6. Operation panel **How to remove** (1)Slide the operation panel in the direction of the arrows, unit it stops. (See figure 3.) (2)Pull out the operation panel as shown in a figure 4. (See figure 4.) **Note :** ① Please pull it out carefully because it is still wired to the body. (3)Take out the panel by detaching the connector of lead wires from the body. (See figure 5.) **Note :** ① If the horizontal slide is hard to remove with hands, put plate on the right edge of the panel (please put protective object such as tapes on the area of contact on the door panel and the operation panel), and gently tap it in the sliding direction. (See figure 3.)	Figure 3  Figure 4  Figure 5 7. Rotational heater board (1)Remove four fixing screws to remove the rotational heater board. (See photo 14) (2)Remove a screw on the wiring cover and disconnect the connector in the cover. (See photo 14) **Caution on assembly** When raising the rotational heater board, replace the rotational heater board as it was. if the refrigerator door is closed with the board raised, the rotational heater board may hit against the left door of refrigerator and be damaged. Though heater preventing dewdrop may make rotational heater board hot, it does not affect food inside. Refer to right figure when installing the rotational heater board. (See figure 6) ●Loosen the fixing screw and adjust a vertical (upper and lower) motion. ●After assembling, make sure that the rotational heater board fits the guide properly and works properly.	Photo 14  Figure 6 
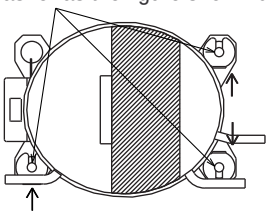
8. Compressor cover → machine chamber fan motor

(1)Remove 7 screws for compressor cover at the back of the refrigerator.

Machine chamber fan motor

(2)Remove screw one fizing screw of bellmouth and connector. Then pull out the bellmouth.
(3)Pull out the fan from the fan motor.
(4)Remove one lid-fixing screws to take out the fan motor.

Attach U washer as the figure shown below.



Piping connection of three-way valve

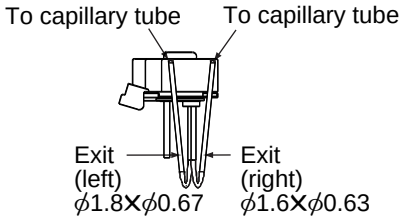


Figure 7

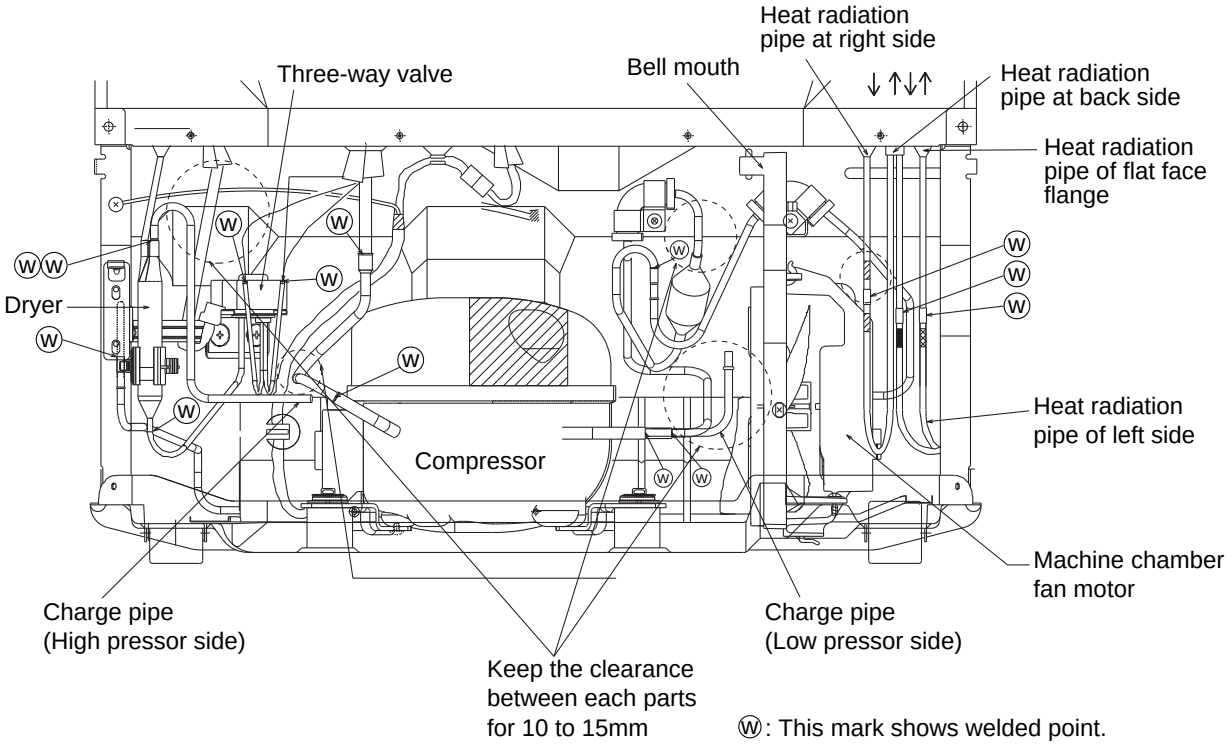
※ Note 1: Form the pipe so that it can be slanted toward the upper right. (Approx. 15 degrees).



Door adjustment

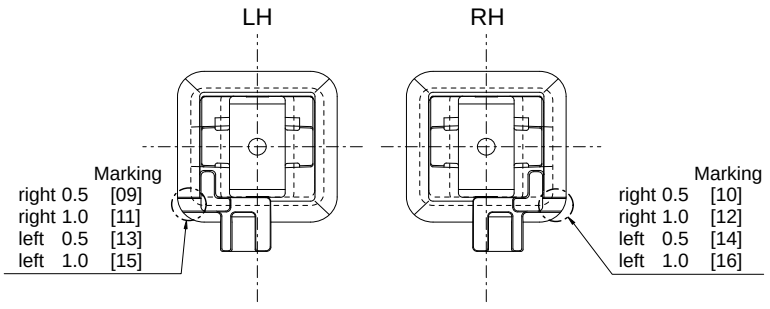
<Adjusting refrigerator compartment doors>
• Common elements
First, check the installation condition.

① If the adjustment bolt is not in contact with the floor, lower the bolt, and adjust it so that the caster is slightly above the floor.
② When the refrigerator is installed in the corner of the room, the bolt of the refrigerator may sink into the floor and cause the refrigerator to tilt. It is recommended to make adjustments by objects like boards beforehand.
③ When the refrigerator bolt is sunk into the floor, and it can be confirmed visually, prevent sinking by using objects like boards.

Note : The refrigerator weighs about 100kg, and is held by four bolts. How far each bolt sinks into the floor depends on factors such as floor pillars. Change in balance due to position of stored food (such as large or small amount of food stored in the door pockets) may also affect sinking.

<Adjusting ice making compartment and versa compartment doors>

	Adjusting doors horizontally	Adjusting vertical space between doors	
		Too much space	Not enough space
Problem	 A>B (More space in outer side) ① Or A<B (More space in inner side)	 A>B (Too much space between the ice making compartment and versa compartment doors.) Misaligned versa compartment door ③ Misaligned ice making compartment door ④	 A<B (Small space between the ice making compartment and versa compartment doors.)Misaligned versa compartment door ⑤ Misaligned ice making compartment door ⑥
Solution	① Place spacer set under the outer roller of the tilted door (ice making compartment door in the above illustration) to adjust position. ② Place spacer set under the inner roller of the tilted door (ice making compartment door in the above illustration) to adjust position.	③ Replace roller set of the right and left versa compartment doors. a To adjust about 0.5mm Replace with roller set C. b To make large adjustment Replace with roller set D. ④ Replace lower roller set of the ice making compartment door. c To adjust about 0.5mm Replace with roller set A. d To make large adjustment Replace with roller set B.	③ Place roller set of the right and left versa compartment doors. a To adjust about 0.5mm Replace with roller set A. b To make large adjustment Replace with roller set B. ⑥ Replace lower roller set of the ice making compartment door. c To adjust about 0.5mm Replace with roller set C. d To make large adjustment Replace with roller set D.



I dentifying roller sets (Marking)

	LH	RH
Roller set A (0.5mm to the right)	09	10
Roller set B (0.5mm to the right)	11	12
Roller set C (0.5mm to the right)	13	14
Roller set D (0.5mm to the right)	15	16

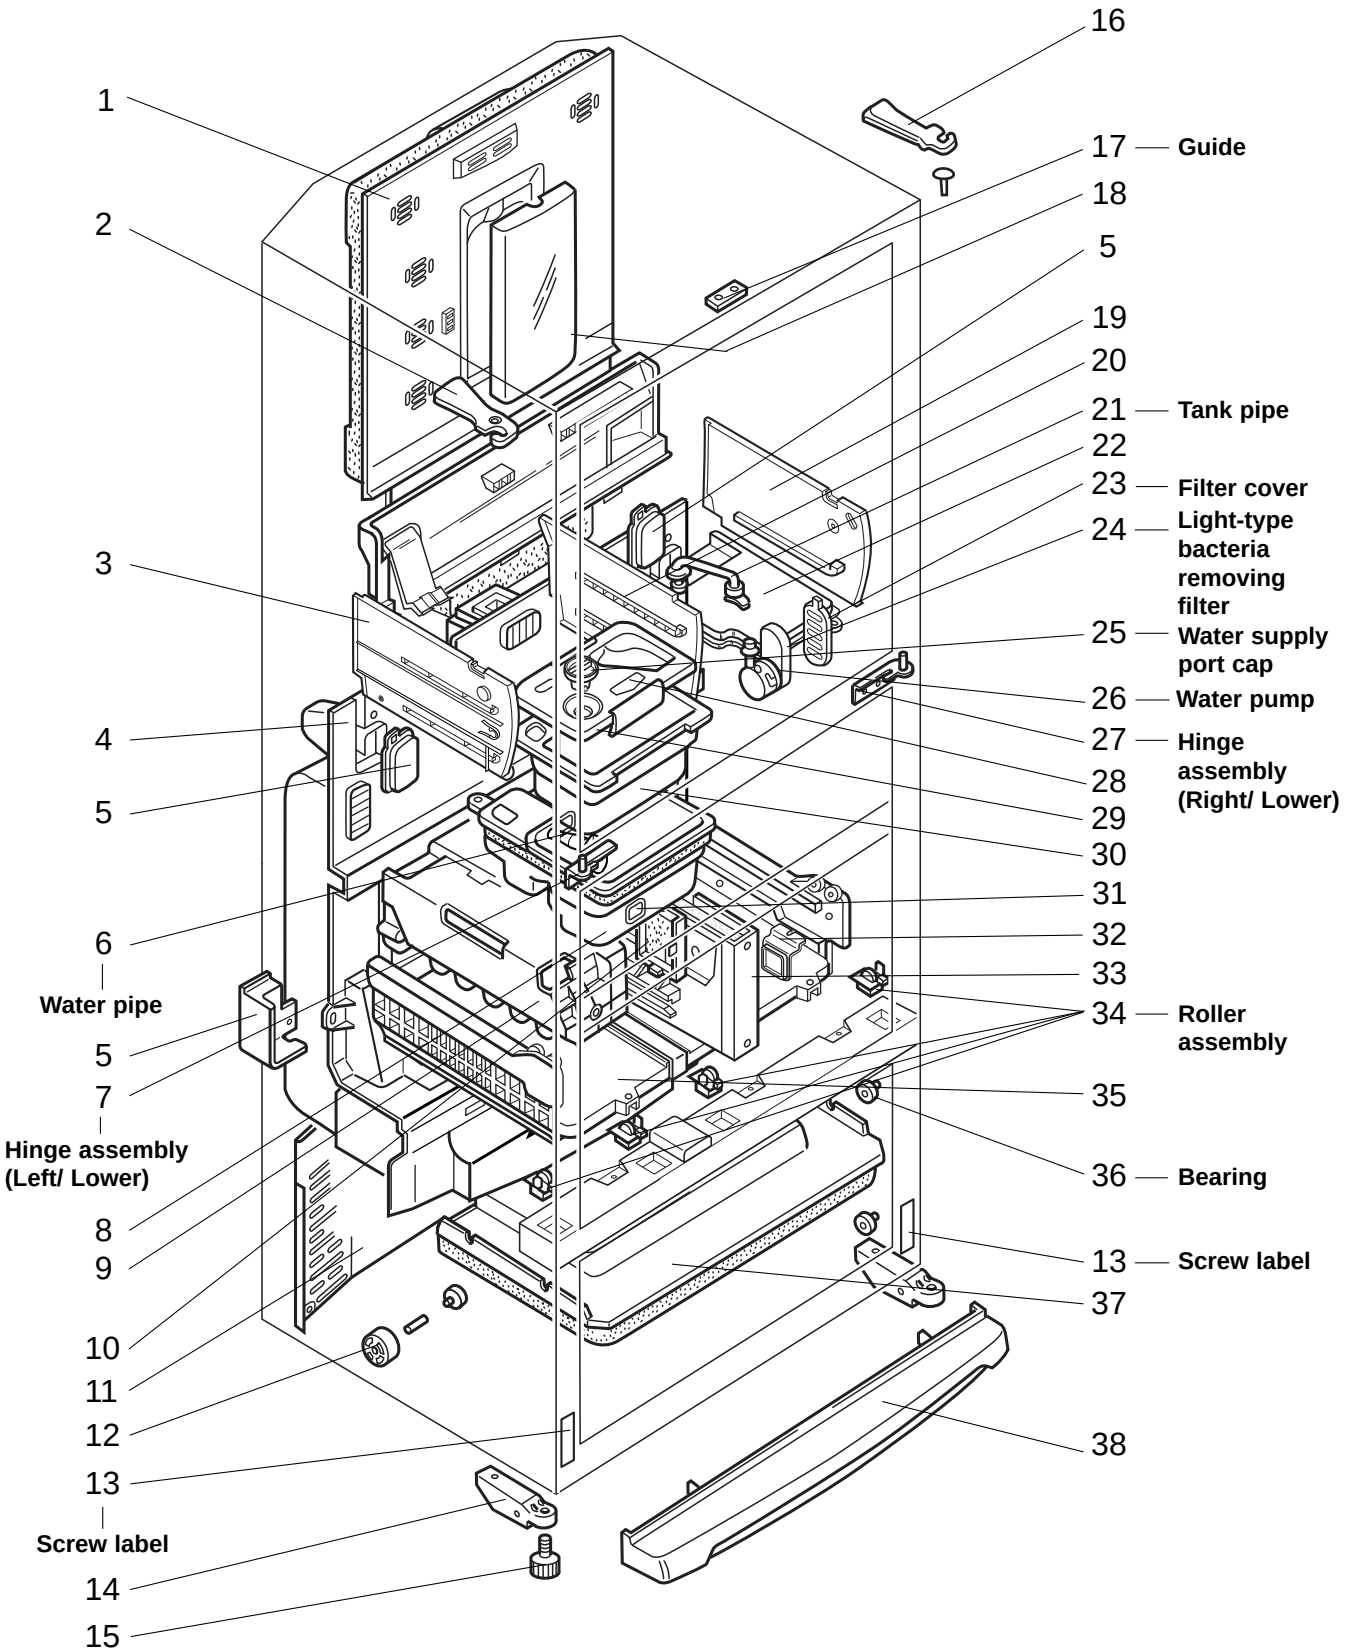
24	G	M20 KG2 110	Door gasket (R/L)		1
25	G	M20 KG0 118	Free pocket (M)		2
26	G	M20 KG0 123	Bottle pocket (S)		1
27	G	M20 KG0 114	Door gasket (I)		1
28	G	M20 KG1 154	Frame (I)		1
29	G	M20 KG0 112	Door gasket (V)		1
30	G	M20 KG0 112	Door gasket (F)		1
31	G	M20 KG0 108	Packing (F)	For interior board of freezer compartment door	1
㉜	G	M20 KL0 607	Spring (Rotational heater board)		1
㉝	G	M20 KW0 717	Upper hinge assembly (Rotational heater board)		1
㉞	G	T1W 06W 715	Lower hinge assembly (Rotational heater board)	With spring	1

※1: Without gasket, Operation panel, Operation P.C. board, Rotational heater board.

BODY PARTS
MR-G50J-SS-NZ



Abbreviation

R.V.	Between refrigerator compartment and vegetable compartment
I.M.	Ice maker
I.S.	Between ice making compartment and versa compartment
V.F.	Between vegetable compartment and freezer compartment
I.S.V	Between ice making compartment, versa compartment and vegetable compartment

Part numbers that are circled are not shown in the figures.

No.	RoHS	Part No.	Part name	Spec. or Drawing No.	MR-G50J NZ SS
1	G	T1W 06W 858	Control panel assembly	※1	1
2	G	M20 KL0 705	Hinge cover (Left)		1
3	G	T1W 06W 863	Left rail of slide compartment		1
4	G	T1W 06W 663	Fan grille	※2	1
5	G	T1W 06W 808	Connector cover (Fan grille)	Three types; One cover each	1
6	G	M20 KA0 525	Water pipe		1
7	G	M20 KA1 702	Hinge assembly (Left/ Lower)		1
8	G	T1W 01W 521	Water tank holder	※3	1
9	G	T1W 01W 350	Automatic ice maker assembly	With ice making tray heater	1
10	G	M20 KL1 442	Cover I.M. assembly		1
11	G	T1W 06W 652	Compressor cover		1
12	G	M20 KA0 794	Caster set		2
13	G	M20 KW0 709	Screw label		2
14	G	M20 KA0 795	Caster assembly		2
15	G	M20 KA0 460	Adjustment bolt		2
16	G	M20 KW0 707	Hinge cover (Right)		1
17	G	M20 KW1 835	Guide		1
18	G	M20 KK4 470	Room light cover		1
19	G	M20 KL0 864	Right rail of slide compartment		1
20	G	M20 KL0 802	Vertical partition		1
21	G	M20 KL0 503	Tank pipe		1
22	G	M20 KG0 802	Ceiling of versa compartment		1
23	G	M20 KW3 442	Filter cover		1
24	G	M20 KW0 526	Light-type bacteria removing filter	Combined with photocatalyst	1
25	G	M20 KL0 531	Water supply port cap		1
26	G	M20 KW0 519	Water pump		1
27	G	M20 KA0 702	Hinge assembly (Right/ Lower)		1
28	G	M20 KL0 527	Water tank cover		1
29	G	M20 KL0 106	Packing (Water tank cover)		1
30	G	M20 KL0 520	Water tank assembly	※4	1
31	G	T1W 01W 524	Tank window		1
32	G	M20 KL2 442	Partition cover		1
33	G	T1W 01W 802	Partition (I.S)	With heater board	1
34	G	M20 KL0 803	Roller assembly	A set for both sides	2
35	G	M20 KG1 846	Partition (I.S.V)		1
36	G	M20 KG1 798	Bearing		4
37	G	T1W 06W 846	Partition (V.F)	With vegetable compartment heater 2	1
38	G	T1W 07W 730	Toe grille		1
(39)	G	M20 KG0 712	Spacer set	For difference adjustment of the I-door and the S-door	2
(40)	G	M20 KW0 805	Rivet		1
(41)	G	M20 KL0 442	Thermistor (I) cover	In the automatic ice maker	1
(42)	G	T1W 06W 107	Packing (Upper)	Compartment side (Upper part)	1
(43)	G	M20 KG0 798	Bearing F/V		4

※1: With motor damper for refrigerator compartment / slide chilled compartment, refrigerator compartment thermistor, slide chilled compartment thermistor, room light socket, refrigerator compartment room light, and duct R (upper/ lower).

※2: With thermal fuse, motor dampers for ice making compartment / versa compartment, and freezer compartment / refrigerator fan motor, fan, vegetable compartment heater 1, thermistors (for versa compartment, ice making compartment, vegetable compartment, and freezer compartment), LED for vegetable compartment.

※3: With water pump motor, water pipe and LED for bacteria removal from water tank.

※4: With tank pipe, filter cover, light-type bacteria removing filter, water pump, water supply port cap, water tank cover and packing (water tank cover).
